Comparing the effects of β-D-Mannuronic acid with Placebo on disease activity and inflammatory markers in patients with Rheumatoid Arthritis

Protocol summary

Summary

The main target of this study is to assess the safety and efficacy of β-D-Mannuronic acid in patients suffering from Rheumatoid Arthritis. B-D-Mannuronic acid which is an anti-inflammatory agent, is ranked in the family of nonsteroidal anti-inflammatory drugs. This agent has expressed qualified therapeutic effects with the greatest tolerability and safety in different experimental models like experimental model of Multiple schlerosis, Rheumatoid arthritis, nephrotic syndrome and acute glomerulonephritis. In this randomized controlled trial, 203 patients afflicted by Rheumatoid Arthritis, diagnosed based on the American College of Rheumatology (ACR) Diagnostic Criteria that have active disease, will be examined. Furthermore, these patients should not have other concomitant diseases such as Hepatic, renal, cardiovascular diseases or malignancies. Written informed consent will be signed by the patients. Then Patients will be randomly divided into two groups (Treatment and Control group). Treatment group (112 patients) will receive β-D-Mannuronic acid 1500 mg/day (three 500 mg tablets/day)with conventional immunosuppressive drugs and Control group (91 patients)) will receive placebo with conventional immunosuppressive drugs orally for 12 weeks. Medical history and clinical parameters including the serum level of CRP, ESR, RF and Anti CCP will be evaluated at baseline and 12 weeks after treatment. The manner of blinding in this study is so neither participants in the study nor the persons who perform the test will be aware of the intervention. In order to allocate the patients randomly into two groups mentioned above, at first 29 blocks of 7 with C and T letters (The letters indicate the Treatment and Control groups) are created. 4 patients of each block belong to the treatment group and 3 patients belong to the control group. Then the blocks are randomly selected and arranged to reach a sequential combination of 203 letters. Each letter will be placed in a sealed packet according to the obtained sequence

Scientific title
Comparing the effects of β-D-Mannuronic acid with Placebo on disease activity and inflammatory markers in patients with Rheumatoid Arthritis

Public title
Evaluation of the therapeutic efficacy of Mannuronic Acid in Rheumatoid Arthritis

Purpose
Treatment

Inclusion/Exclusion criteria
Inclusion Criteria: 1.Patients should be 18-65 year old, afflicted by Rheumatoid Arthritis, diagnosed based on the American College of Rheumatology (ACR) Diagnostic Criteria by a rheumatology specialist after evaluating the clinical parameters such as ESR, RF, CRP and Anti-CCP. 2.Each patient must sign written informed consent. 3.The disease in all patients should be in active form (DAS28>2.6) 4.None of patients must suffer from another concomitant diseases like Hepatic, renal, haematological, gastrointestinal, endocrine, cardiovascular, pulmonary, neurological or cerebral diseases. Exclusion Criteria: 1.History of fever and Infectious diseases, positive pregnancy test or lactation, other collagen- vascular diseases, other auto-immune diseases and Malignancies. 2.Enrolling in another clinical trial study within last 4 weeks 3.Suffering from other concomitant diseases such as hepatic, renal, hematological, gastrointestinal, endocrine, cardiovascular, pulmonary, neurological or cerebral disease.

Health conditions studied

1

Description of health condition studied
Rheumatoid Arthritis

ICD-10 code
M05

ICD-10 code description
Seropositive Rheumatoid Arthritis

Primary outcomes

1

Description
Morning stiffness

Timepoint
At baseline and after 12 weeks of treatment

Method of measurement
Taking history and Questionnaire

2

Description
The number of swollen joints

Timepoint
At baseline and after 12 weeks of treatment

Method of measurement
Examination

3

Description
Pain

Timepoint
At baseline and after 12 weeks of treatment

Method of measurement
Examination

4

Description
Severity of disease
Timepoint
At baseline and after 12 weeks of treatment
Method of measurement
Taking history and Questionnaire

Secondary outcomes

1

Description
Serum level of CRP
Timepoint
At baseline and after 12 weeks of treatment
Method of measurement
Turbidometry

2

Description
level of ESR
Timepoint
At baseline and after 12 weeks of treatment
Method of measurement
See through Westergren method

3

Description
Anti-cyclic Citrullinated Peptide (anti-CCP) Antibodies
Timepoint
At baseline and after 12 weeks of treatment
Method of measurement
ELISA

4

Description
Rheumatoid factor (RF)
Timepoint
At baseline and after 12 weeks of treatment
Method of measurement
See through Agglutination

Intervention groups

1

Description
The Treatment group will receive β-D-Mannuronic acid 1500 mg/day (three oral 500 mg tablets/day) which is produced from the decomposition of Alginate powder (a safe and natural substance used in food and pharmaceutical industries) for 12 weeks. It should be mentioned that Alginate powder is purchased from Sigma Corporation of U.S.A and β-D-Mannuronic acid is produced from it's decomposition in central laboratory of immunology department at School of Public Health and Institute of Health Research affiliated by Tehran University of Medical Sciences.
Category
Treatment - Drugs

2

Description
The control group will receive orally 1500 mg/day (three 500 mg tablets/day) of plcebo for 12 weeks.
Category
Treatment - Drugs
