Evaluation of intravenous magnesium sulphate in clinical improvement of patients, with acute stroke

Protocol summary

Summary

Background: This study evaluated the effect of intravenous magnesium sulphate in clinical improvement of the patients with acute stroke. In various studies, there is a lot of information about the use of magnesium sulphate in different conditions of brain ischemia. while neuroprotective effects of magnesium sulphate as a neuroprotective agent has been demonstrated in focal and global brain ischemia, in animal models, but the effect of this agent is still unclear. Methods: 80 patients (In this study, 47 percent of patients was female and 53 percent was male) of with acute ischemic stroke signs and symptoms lasting less than 12 hours were included in the study and were divided into two groups, 40 patients received 4 g of MgSO₄ over 15 minutes and then 16 g over the next 24 hours, and 40 patients were received placebo. Results: the results show that the rate of clinical improvement was better in group with magnesium sulphate, than the control group. The highest correlation of magnesium sulphate was associated with improvement of upper and lower muscle forces and aphasia and level of consciousness of patients results. The results showed that, in the group with magnesium sulphate, the patients with Grade III decreased and the patient with Grade II, I increased. After 2 weeks in this Group the patients with Grade III, decreased to 12.5 percent and the patients with Grade II and I, increased to 50 percent and 37.5 percent. (According to national institutes of health stroke scale). Conclusion: According to this study, magnesium sulphate, can be used as a neuroprotective agent in patients with acute stroke. Key words: magnesium sulphate, stroke, neuroprotective

Scientific title

Evaluation of intravenous magnesium sulphate in clinical improvement of patients, with acute stroke

Public title

Evaluation of intravenous magnesium sulphate in clinical

improvement of patients, with acute stroke, in Ardabil Alavi hospital

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: Age greater than 18 years old; Age less than 80 years old; onset of symptoms less than 12 hour .

Exclusion criteria: : Patient with chronic renal failure (more than 5.2); pregnant patients; patients with brain hemorrhage; age less than 18 years old; systolic blood pressure greater than 220 and diastolic lower than 90; patient with severe respiratory disease; patient with heart block; Patients with pre-existing neurological disease or progressive systemic disease that can impair neurological assessment.

Age

From **18 years** old to **80 years** old

Gender

Both

Phase

2-3

Groups that have been masked

No information

Sample size

Target sample size: **80**

Health conditions studied

1

Description of health condition studied

Stroke

ICD-10 code

I64

ICD-10 code description

Accident - vascular, brain

Primary outcomes

1

Description

Degree of limb paresis

Timepoint

Admission - three days later - two weeks later

Method of measurement

Standard questionnaire NIHSS

2

Description

Aphasia

Timepoint

Admission - three days later - two weeks later

Method of measurement

Standard questionnaire NIHSS

3

Description

level of consciousness

Timepoint

Admission - three days later - two weeks later

Method of measurement

Standard questionnaire NIHSS

Secondary outcomes

1

Description

The rate of cerebral ischemia.

Timepoint

3 day later - 2 week later

Method of measurement

CT-scan

Intervention groups

1

Description

In the control group the same amount of volume, not weight of normal saline solution over 15 minutes and then within 24 hours for patient was given.

Category

Placebo

2

Description

In the intervention group magnesium sulfate vials has been given for the patient that have stroke in last 12 hour, 4 g intravenous magnesium sulfate in less than 15 minute and then 16 g within 24 hour has been given, the patients was controlled in admission and 3 day later and 2 week later.
