Comparison of the Effects of Isolated Pelvic Floor Muscles Training, Deep Abdominal Muscles Training and Their Combination in Quality of Life of Females with Stress Urinary Incontinence.

Protocol summary

Summary

The aim of this study is to investigate the effects of pelvic floor muscles (PFM) training, deep abdominal muscles training and their combination on the quality of life of females with stress urinary incontinence (SUI). This study is a double - blind (subjects and examiners), randomized controlled trial. 54 females with SUI will be included in this study. Subjects will be excluded if they have a history of surgery involving the pelvic floor; neurological or psychiatric disease or a major medical condition, current pregnancy or less than 3 months postpartum and prolapse. Patients will be randomly assigned into 3 treatment groups; the first group receives a conventional treatment with focus of the PFM, the second group will perform only transverse abdominal (TrA) muscle exercises and third; cocontraction of both PFM and TrA. Exercises progress from simple to functional. Physiotherapist will instruct and monitor exercises 1 day a week and will check exercises using telephone calls twice a week for 8 weeks. To record the quality of life, Incontinence Quality of Life (I-QOL) Questionnaire and to access maximal voluntary contraction (MVC) and endurance of pelvic floor muscles perinometer will be used before and after treatment interventions. Main outcome measures such as I-QOL scale, MVC and endurance of PFM will be reported.

Scientific title

Comparison of the Effects of Isolated Pelvic Floor Muscles Training, Deep Abdominal Muscles Training and Their Combination in Quality of Life of Females with Stress Urinary Incontinence.

Public title

Comparison of the Effects of Isolated Pelvic Floor Muscles

Training, Deep Abdominal Muscles Training and Their Combination in Management of Stress Urinary Incontinence.

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion Criteria: Females with SUI in the age range of 18-60 years will be included in this study if they have complaint of involuntary leakage of urine on effort or on sneezing or coughing. Exclusion Criteria: Subjects will be excluded if they have a history of surgery involving the pelvic floor; neurological or psychiatric disease or a major medical condition; current pregnancy or less than 3 months postpartum; prolapse; severe low back pain or pelvic pain; ongoing urinary tract infections and undergoing concurrent treatment for SUI.

Age

From **18 years** old to **60 years** old

Intervention groups

1

Description

Intervention 1: Participants in the pelvic training group will be instructed to contract PFM .Vaginal palpation will be applied for the valid evaluation of vaginal squeeze pressure. Contraction of PFM will be progressed by positioning in: 1st session: crook; 2nd: supine; 3rd: side lying; 4th: sitting; 5th: standing; 6th, 7th: walking and last: ADL. Individuals will meet physiotherapist once a week to be instructed new exercise and physiotherapist will check exercises using telephone calls twice a week for 8 weeks. Participants will perform exercises 3 sets, 2 times a day .Each set contains 10 repetition of isolated

MVC of PFM as long as possible (maximum: 10 seconds) and 5 fast contraction(contraction: 1 second, rest:1second).

Category

Rehabilitation

2

Description

Intervention 2: Participants in the deep abdominal muscles training group will be instructed to contract Transversus Abdominis. Contraction of TrA will be progressed by positioning in: 1st session: crook; 2nd: crook with flexion and extension of knee; 3rd: crook with flexion and extension of shoulder; 4th: sitting; 5th: standing; 6th, 7th: walking and last: ADL. Individuals will meet physiotherapist once a week to be instructed new exercise and physiotherapist will check exercises using telephone calls twice a week for 8 weeks. Participants will perform exercises 3 sets, 2 times a day .Each set contains 10 repetition of isolated maximum voluntary contraction of TrA as long as possible (maximum: 10 seconds) and 5 fast contraction (contraction: 1 second, rest:1second).

Category

Rehabilitation

3

Description

Intervention 3 : Participants in the combination of pelvic and abdominal muscles training group will be instructed to contract PFM and TrA. Vaginal palpation will be applied for the evaluation of vaginal squeeze pressure. Cocontraction of PFM and TrA will be progressed by positioning in: 1st session: crook; 2nd: supine; 3rd: side lying; 4th: sitting; 5th: standing; 6th, 7th: walking and last: ADL. Individuals will meet physiotherapist once a week to be instructed new exercise and physiotherapist will check exercises using telephone calls twice a week for 8 weeks. Participants will perform exercises 3 sets, 2 times a day .Each set contains 10 repetition of isolated maximum voluntary Cocontraction of PFM and TrA as long as possible (maximum: 10 seconds) and 5 fast contraction (contraction: 1 second, rest:1second).
