The effect of trunk Core stability exercises on improving balance

Protocol summary

Summary

The aim of this study is to investigate the effect of exercise on improving static balance, dynamic, and balance function in patients with acute ischemic stroke under. The study is a randomized controlled trial. 40 patients with acute ischemic stroke were randomly divided into 2 groups of 20 persons (experimental group received conventional therapy plus trunk strengthening exercises core stability, and the control group received conventional physical therapy). Demographic and clinical groups (balance sheet, test Tinetti, balance assessment tests Brunel) were collected and measured before and after the intervention. Group exercise will be carried out for 6 weeks and 3 times a week for 60 minutes. Conventional physical therapy program, patients will be included (static balance exercises, dynamic and functional, tons of training, stretching, range of motion exercises for the hemiparesis, and walk in Yaraal, and movements related Hdfhmnd. In addition to conventional physical therapy patients in the experimental group, they did Stabilization training of the trunk muscles by 20 minutes per session.

Scientific title

The effect of trunk Core stability exercises on improving balance

Public title

The effect of trunk Core stability exercises on improving balance in patients with subacute ischemic stroke.

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria: acute ischemic stroke, unable to keep his balance standing and sitting for more than 5 seconds; having age between 65 to 80 years, selected about a month of getting them for the first time have suffered a stroke. Exclusion criteria: the inability to score more than three (pre-stroke), an orthopedic or neurological disorders affecting the balance in sitting or standing; the level of mini mental statement less than 24 points, having apraxia; hemineglect.

Age

From **64 years** old to **79 years** old

Gender

Both

Phase
