

Clinical Trial Protocol

Iranian Registry of Clinical Trials

10 Jun 2026

The Efficacy of Occupation-Based and Exercise-Based Interventions on Performance Components and Areas of Occupation in Subjects with Chronic Stroke (Clinical Trial)

Protocol summary

Study aim

1. Comparison of the efficacy of occupation-based, exercise-based intervention and traditional interventions on parameters of motor control strategies of upper limb in reach and grasp in people with chronic stroke
2. Comparison of the efficacy of occupation-based, exercise-based intervention and traditional interventions on cognitive function, upper limb function, balance and functional mobility in people with chronic stroke
3. Comparison of the efficacy of occupation-based, exercise-based intervention and traditional interventions on participation in occupational areas in people with chronic stroke

Design

45 chronic stroke patients who have the eligibility criteria will be included in the study and will be randomly assigned to one of the three groups of occupation-based intervention, exercise-based intervention or control group. The sample size is 15 people per group.

Settings and conduct

In this randomized clinical trial, eligible patients will be recruited and randomly assigned to one of three groups. Interventions will be provided for 3 months in all groups. Interventions and assessments will be conducted mainly in school of rehabilitation and Dr. Movafaghiyan research center. The assessment of primary and secondary outcomes will be done by a researcher who is not aware of the patients' assignment.

Participants/Inclusion and exclusion criteria

We will recruit chronic stroke patients who experience the first stroke and have no history of other neurological disorders and depression before stroke onset. Patients who experience another stroke and patients with inappropriate collaboration will be excluded.

Intervention groups

In occupation based group, "cognitive orientation to daily occupational performance" will be used. This is a client-

centered problem-solving protocol which focuses directly on improving performance in everyday life activity rather than treating the underlying impairments. Intervention in the exercise based group will be a structured exercise protocol including the range of motion and strengthening exercises, balance and endurance training and functional use of the upper extremity. Participants in the routine occupational therapy group will receive traditional occupational therapy including neurodevelopmental methods, stretching and strengthening programs, positioning, training of balance and fine motor skills and functional exercises.

Main outcome variables

1. Participation in occupational areas
2. Performance components including upper limb function, balance and functional mobility and cognition

Scientific title
The Efficacy of Occupation-Based and Exercise-Based Interventions on Performance Components and Areas of Occupation in Subjects with Chronic Stroke (Clinical Trial)

Public title
The Efficacy of Occupation-Based and Exercise-Based Interventions in Stroke Subjects

Purpose
Treatment

Inclusion/Exclusion criteria
Inclusion criteria:
Stroke survivors who are experiencing first occurrence of stroke. Are 24 to 80 years old. Are in chronic phase of stroke (6 months to 5 years). Acquire a score equitable or higher than 24 in Mini-Mental State Exam. Have no history of other neurological disabilities. Have the ability to grasp and release a block of Box and Bloc Test. Are able to walk at least 3 meter with or without assistive devices. Understand the global strategy of the occupation-based intervention (Cognitive Orientation to Daily Occupational Performance). Have no history of depression before stroke onset.
Exclusion criteria:
Patients who experience two or more stroke.

Age
From **24 years** old to **80 years** old

Gender
Both

Phase
N/A

Groups that have been masked

- Outcome assessor

Sample size
Target sample size: **45**

Randomization (investigator's opinion)
Randomized

Randomization description
According to "Table of Random Numbers" participants will be randomly assigned to three groups of occupation-based intervention, exercise-based intervention or

control group.

Blinding (investigator's opinion)
Single blinded

Blinding description
The present study is an assessor blind study in which interventions in each group will be delivered by a therapist and outcome measurements will be conducted by another researcher who is not aware of participant's assignment.

Placebo

Health conditions studied

1

Description of health condition studied
Stroke

ICD-10 code
I64

ICD-10 code description
Stroke, not specified as haemorrhage or infarction

Primary outcomes

1

Description
Participation in Occupational Areas

Timepoint
Pre-test, 12 Sessions after onset of intervention, Post-test and Follow up

Method of measurement

Canadian Occupational Performance Measure, Goal Attainment Scale, Stroke Impact Scale, Community Integration Questionnaire, Barthel and Katz Index, Lawton Instrumental Activity of Daily Living Scale

2

Description

Upper Extremity Function

Timepoint

Pre-test, 12 Sessions after onset of intervention, Post-test and Follow up

Method of measurement

Fugl-Meyer assessment, Motor Activity Log, Wolf Motor Function, Box and Block Test

3

Description

Functional Mobility and Balance

Timepoint

Pre-test, 12 Sessions after onset of intervention, Post-test and Follow up

Method of measurement

Timed Up and Go, Dynamic Gait Index, Functional Reach Test and Timed 10 Meter Walk Test

4

Description

Cognitive Function

Timepoint

Pre-test, 12 Sessions after onset of intervention, Post-test and Follow up

Method of measurement

Stroop Test, Wisconsin Card Sorting Test, Trail Making and Digit Span Subtest of Wechsler Memory Scale

Secondary outcomes

1

Description

Parameters of Motor Control Strategies of Upper Limb in Reach and Grasp of a subject on Single and Dual Tasks

Timepoint

Pre-test and Post-test

Method of measurement

Clinical and Laboratory Assessment of Single and Dual Task

Intervention groups

1

Description

Intervention Group1: In occupation based group, "cognitive orientation to daily occupational performance" will be used. This is a client-centered problem-solving protocol which focuses directly on improving performance in everyday life activity rather than

Category

Rehabilitation

2

Description

Intervention Group2: Intervention in exercise-based group will be a structured exercise protocol including the range of motion and strengthening exercises, balance and endurance training and functional use of the upper extremity.

Category

Rehabilitation

3

Description

Control Group: Participants in this group, will receive traditional occupational therapy including neurodevelopmental methods, stretching and strengthening programs, positioning, training of balance and fine motor skills and functional exercises.

When the data will become available and for how long

After publishing the articles

To whom data/document is available

Researchers intending to research in this field.

Under which criteria data/document could be used

-Obtaining written permission from the research team -
Mention the source of information

From where data/document is obtainable

-Mahnaz Hejazi Shirmard: School of Rehabilitation, Shahid Shahnazari Street, Madar Square, Mirdamad Blvd, Tehran. Email Adress: M.hejazishirmard@yahoo.com -Dr. Laleh Lajevardi: School of Rehabilitation, Shahid Shahnazari Street, Madar Square, Mirdamad Blvd, Tehran. Email Adress: Lajevardi.l@iums.ac.ir

What processes are involved for a request to access data/document

After sending the email to the researcher and requesting the document, the researcher will request the opinion of other members of the research team regarding the provision of this information and, if the members agree, the documents will be sent as soon as possible but sending the documents requires the acceptance of the criteria mentioned above.
