Compare the effect of task oriented training and conventional physiotherapy on balance in hemiplegic patients following stroke

Protocol summary

Summary

Objectives: The effect of task oriented training and conventional physical therapy on balance in hemiplegic patients following stroke will be compared. Design: In this clinical trial, 20 hemiplegic patients following stroke will be divided randomly (people with odd inclusion number in the control group and those with even inclusion number in experimental group) in two groups of task oriented training and conventional physical therapy. Setting and conduct: Individuals will participate in 4-weeks therapy sessions 3 times a week for about 2 hours. Major inclusion and exclusion criteria: Inclusion criteria include: hemiplegia secondary to stroke; clear asymmetry in weight bearing; the ability to independent walking for at least 10 meters; passing less than three months after stroke and the Berg Balance Scale in the range of 30 to 40 and Exclusion criteria include: impaired vision; the absence of any neurological or orthopedic diseases affecting patients postural disorder and any disease that limited patient's participation in the study. Interventions: Task-oriented training and conventional physiotherapy exercises Main outcome variables include: The Berg Balance Scale will be used to measure functional balance and pressure distribution of foot, the center of pressure path length and the center of pressure confidence ellipse area will be used to evaluate static balance by means of pressure distribution zebris system while standing with open eyes before and after the treatment.

Method of measurement

Intervention groups**1****Description**

Intervention group: Task oriented training, three times a week for four weeks over twelve sessions. Each session takes about 2 hours. 1) sitting on a chair and reaching objects in all directions at a distance of more than arm's length; 2) forward, backward and side way stepping up; 3) flexion and extension the affected knee, while the affected foot located on the exercise step; 4) stepping over obstacles with different heights; 5) standing up from a chair, walking four steps forward, touching a stool and then returning to the chair; 6) sitting on a Swiss ball while doing range of motion and balance exercise in the trunk and upper extremities; 7) double leg stand for 10 seconds; 8) tandem stand (the heel of one foot in front of the other foot) for 10 seconds; 9) standing up from a chair without using the arms; 10) tandem walking forward and backward. The four last exercises have been done in different situation as follows: 1) with open eyes and a hard surface, 2) with open eyes and a soft surface, 3) with closed eyes and hard surface; 4) with closed eyes and smooth surface

Description

Control group: conventional physiotherapy, three times a week for four weeks over twelve sessions. Each session takes about 2 hours. Exercises to improve balance, increase muscle strength, range of motion and walking through weight training or weight transfer in the parallel bars, mats exercise (strengthening, stretching, range of motion) and correct gait training in parallel bar
