

Clinical Trial Protocol

Iranian Registry of Clinical Trials

13 Jun 2026

Evaluation of the effect of isokinetic exercise with conventional physiotherapy on power in patients with knee osteoarthritis.

Protocol summary

Summary

Introduction: Osteoarthritis (OA) is one of the prevalent disease in Joints. The Knee joint is the most frequently involved than other joint to OA. The research had shown quadriceps muscles weakness and proprioceptive deficits in patient related to knee osteoarthritis. The pharmacological treatment approaches that are used for management of knee OA, only reduce pain and swelling, on the other hand, these approaches have different complication with them. So using none-pharmacological treatments such as exercise performing, are very important. The aim of this study is evaluation of the effect of isokinetic exercise with conventional physiotherapy on power and rate of Stiffness in patients with knee osteoarthritis. Methods: In this study with type "single blinded semi practical clinical trials" 30 women patient with mild to moderate knee osteoarthritis without pregnancy in age from 45-65 were used and divided into two groups (control and treatment). Exit criteria of this study were acute disease, existence of pain doing exercise and the intensification of pain under exercise. The first group (as control group) received routine knee physical therapy modalities; the second group (as isokinetic training group) in addition to routine protocol received isokinetic training. Rate of stiffness by questioner of Western Ontario McMasters Osteoarthritis index (WOMAC), and their power was evaluated by Biodex4.

Scientific title

Evaluation of the effect of isokinetic exercise with conventional physiotherapy on power in patients with knee osteoarthritis.

Public title

The effect of isokinetic exercise in patients with knee osteoarthritis.

Purpose

Other

Inclusion/Exclusion criteria

inclusion criteria: patient with mild to moderate knee osteoarthritis without pregnancy in age from 45-65, existence of balance, lack of skin wound about knee. Exclusion criteria: acute disease, existence of pain doing exercise and the intensification of pain under exercise, surgery background in knee joint.

Age

From **45 years** old to **65 years** old

Gender

Female

Phase

2

Groups that have been masked

No information

Sample size

Target sample size: **30**

Health conditions studied

1

Description of health condition studied

knee Osteoarthritis

ICD-10 code

M19.9

ICD-10 code description

knee Osteoarthritis

Primary outcomes

1

Description

Power Increasing

Timepoint

Before, After 6 sessions and after intervention

Method of measurement

Biodex 4

Secondary outcomes

1

Description

Rate of Stiffness

Timepoint

Before, After 6 sessions and after intervention

Method of measurement

Biodex 4

Intervention groups

1

Description

Interventional group sit on chair of biodex 4 and then resistance pad of device was placed the top of leg ankle. Movement domain in range of flexion and full extension, and damping device was regulated hard. Concentric contraction with 10 to 90 degree, the 60-90 speed, 10 replications with six set (between sets 30 -60 second was given rest) defined for biodex4

Category

Rehabilitation

2

Description

For the first group (as control group) received routine knee physical therapy modalities.
