Study of the clinical and microbiologic effects of 940 nm Diode laser as an adjunct to scaling and root planing in treatment of Chronic periodontitis

Protocol summary

Study aim

This study was undertaken to evaluate the effect of 940-nm diode laser on clinical parameters and microbial load in patients with chronic periodontitis.

Design

Randomized, single blinded, clinical trial

Settings and conduct

This study will be carried out on patients referred to Faculty of Dentistry, Shahed University, Tehran. Full-mouth SRP will be done with an ultrasonic device. Oral hygiene instructions, consisting of correct brushing technique and correct use of dental floss will be given to each patient. One week after completion of SRP in the test group after simple randomization with random number, 940-nm diode laser beams will be applied. One tooth from each quadrant will be selected for evaluation of clinical and microbiological parameters. Sterile paper cones will be placed in the deepest area of the pocket and after 20 seconds will be immediately placed in tubes for transferring to the laboratory. All the four samples of each patient will be sent to the laboratory. Real-time PCR will be used to determine pathogen counts.

Participants/inclusion and exclusion criteria

Inclusion criteria: -Subjects had moderate-to-severe chronic periodontitis. -At least one pocket, measuring 4–6 mm in depth, and bleeding on probing in each quadrant. -Systemic health. -Lack of active root infection or teeth caries. Exclusion criteria: -Lack of compliance. -Periodontal pockets deeper than 10 mm, and severe luxation (third degree). -Antibiotics intake during the research and in previous three months. -Smoking

Intervention groups

1. Scaling root planing as conventional treatment
2. Scaling root planing + 940 nm diode laser application

Main outcome variables

Papillary bleeding index (PBI), probing pocket depth (PPD), clinical attachment level (CAL), modified gingival index (MGI) and margin level (ML), and microbial load

Scientific title

Study of the clinical and microbiologic effects of 940 nm Diode laser as an adjunct to scaling and root planing in treatment of Chronic periodontitis

Public title

Laser in periodontitis treatment

Purpose

Treatment

Inclusion/Exclusion criteria**Inclusion criteria:**

Moderate to severe chronic generalized periodontitis, presence of one pocket measuring 4–6 mm in depth and bleeding on probing in all the 4 quadrants Systemic health

Exclusion criteria:

Presence of radicular infection or active caries Systemic diseases

Age

No age limit

Gender

Both

Phase

N/A

Groups that have been masked

Primary outcomes**1****Description**

Pocket Probing Depth

Timepoint

before treatment, 1 month and 3 month after treatment

Method of measurement

The distance between the gingival margin and the pocket base, which will be measured at 6 points of each tooth (mesiobuccal, buccal, distobuccal, distolingual, lingual and mesiolingual) with the use of a Williams graduated probe. The mean probing depth at each site will be registered as the probing depth in that area.
