Comparison of the effect of oral immunotherapy with cow's milk products and conventional desensitization in children with allergy to heated cow's milk: a clinical trial

Protocol summary

Study aim

desensitization in patients with cow milk allergy

Design

Triple-blind randomized placebo controlled clinical trial, community based, two parallel group design with 25 patients suffering from type 1 hypersensitivity

Settings and conduct

In the allergy and immunology clinic patients were randomized into milk and muffins groups. for all patients before and after desensitization skin prick test, IgE serum level test, the eosinophil and T regulatory cell counting were performed. The study is triple-blinded.

Participants/Inclusion and exclusion criteria

Inclusion criteria: patients two years and older; presentation of skin symptoms such as urticaria, erythema and angioedem; gastrointestinal symptoms such as severe vomiting, abdominal pain and diarrhea; respiratory symptoms such as rhinitis and bronchospasm; these symptoms should be present up to two hours after exposure; these symptoms should be present at least in last six months; positive skin prick test for cow's milk or measurement of sIgE for cow's milk
Exclusion criteria:cellular immune response that it's not mediated by IgE; malignancy or severe immunodeficiency disorders; using beta blockers; uncontrolled severe persistent asthma; Cardiovascular disease that epinephrine administration in them is contraindicated; Taking immunosuppressive drugs; Eosinophilic Gastrointestinal; Disorder that produced by the milk and it diagnosed

Intervention groups

In the intervention, 12 patients (2 female and 10 male) used heated cow milk (muffin). In control group, 13 patients (5 female and 8 male) underwent oral immunotherapy with cow milk.

Main outcome variables

Regulatory T cell; Specific IGE for milk; Milk

Desensitization

Scientific title
Comparison of the effect of oral immunotherapy with cow's milk products and conventional desensitization in children with allergy to heated cow's milk: a clinical trial

Public title
clinical trial of the effect of raw and cooked milk immunotherapy in children with milk allergy

Purpose
Prevention

Inclusion/Exclusion criteria
Inclusion criteria:
patients two years and older Presentation of skin symptoms such as urticaria, erythema and angioedema gastrointestinal symptoms such as severe vomiting, abdominal pain and diarrhea respiratory symptoms such as rhinitis and bronchospasm Presentation of the symptoms up to two hours after exposure these symptoms should be present at least in last six months positive skin prick test for cow's milk or measurement of sIgE for cow's milk positive challenge test with cow's milk

Exclusion criteria:
cellular immune response that is not mediated by IgE malignancy or severe immunodeficiency disorders using beta blockers uncontrolled severe persistent asthma Cardiovascular disease that epinephrine administration is contraindicated in them Taking immunosuppressive drugs previously diagnosed Eosinophilic Gastrointestinal Disorder in response to milk

Age
From **2 years** old to **15 years** old

Gender
Both

Phase
2

Groups that have been masked

- Participant
- Care provider
- Data analyser

Sample size
Target sample size: **25**

Randomization (investigator's opinion)
Randomized

Randomization description
Method of simple randomization

Blinding (investigator's opinion)
Triple blinded

Blinding description
1- participants, 2- Physicians, and nurses, who care for participants, 3- data analyser

Placebo

Description of health condition studied

food allergy

ICD-10 code

T78.4

ICD-10 code description

Allergy, unspecified

Primary outcomes

1

Description

regulatory T cell

Timepoint

Before intervention, after intervention

Method of measurement

Flow cytometry

2

Description

Specific IGE for milk

Timepoint

Before intervention, after intervention

Method of measurement

RIDA

3

Description

Milk Desensitization

Timepoint

Before intervention, after intervention
Method of measurement
Clinical

Secondary outcomes

1

Description

symptoms,anaphylaxis,desensitization

Timepoint

Immediately after intervention.

Method of measurement

physical examination

Intervention groups

1

Description

In the intervention group, certain amount of muffin is given to patients and they are monitored for 4 hours under medical observation. Then desensitization with 1.8 muffin's slice is initiated and the dosage will be added monthly (For 4 to 6 months) until it reaches one complete muffin.

Category

Other

2

Description

In the control group, certain amount of milk is given to patients and they are monitored for half an hour under medical observation. the desensitization is initiated with 0.1mL of cow's milk and the dosage will be added weekly (For 10 to 12 weeks) until it reaches the amount of 200 cc.
