Vitamin D Status and Response to Vitamin D3 (50000 unit supplementation) in pregnant Iranian woman

Protocol summary

Study aim

The aim of this study was to identify the prevalence of vitamin D deficiency in an Iranian pregnant population and to analyze the impact of implementing a screening and treatment protocol by Vitamin D3 (50000 unit supplementation) among them.

Design

This is conducted at a prenatal care clinic in Tehran, Iran. Of total 357 pregnant women, 249 patients had first trimester and 278 had third trimester vitamin D level. The final sample size of this study was 216. The screening for vitamin D deficiency was typically performed at two points throughout prenatal care: one at the initial prenatal visit and another at approximately 28 weeks' gestation. If Vitamin D status was insufficient an additional vitamin D3 supplement of 50,000 IU of ergocalciferol was prescribed weekly for 10 weeks. Due to ethical issues, the control group without the supplementation was removed.

Settings and conduct

This study designed and conducted at a prenatal care clinic in Tehran, Iran. 357 cases were identified.

Participants/Inclusion and exclusion criteria

inclusion criteria: (1) maternal age of 16 years or greater at the time of consent, (2) confirmed singleton pregnancy of less than 16 weeks' gestation at the time of consent, (3) planned to receive ongoing prenatal care in our prenatal clinic in Tehran, (4) they had at least two measurements of vitamin D levels in the first or second trimesters and in the third trimester. Exclusion criteria included twin pregnancy, maternal immune deficiency disease, and a history of gastric bypass surgery.

Intervention groups

If Vitamin D status was insufficient an additional vitamin D3 supplement of 50,000 IU of ergocalciferol was prescribed weekly for 10 weeks.

Main outcome variables

change of vitamin D level
