The Effect of group Therapy Based on Transactional Analysis on Marital Satisfaction and Resilience of Women with infertility

Protocol summary

Marital satisfaction, Resiliency

Study aim

Determining the Effect of Transactional Analysis on Marital Satisfaction and Resilience of Infertile Women

Design

The Clinical trials with control group, with parallel groups, randomized

Settings and conduct

Anrich's Marital Satisfaction Scale and the Connor Davidson, Resilience scale were distributed and completed among all infertile women who came there and were willing to participate in the study. Subjects then use the table. Random numbers were selected randomly and divided into two groups: intervention and control. The sample size was considered as 15 in each group. In the next step, the Group therapy with Transactional Analysis was done twice a week and in group session in 8 sessions of 2 hours for the intervention group. Finally, after intervention, to investigate the effect of interpersonal behavior analysis, these questionnaires were presented to intervention and control groups.

Participants/Inclusion and exclusion criteria

Inclusion criteria: 1.Diagnosis of infertility by a specialist
2.Have at least reading and writing skills 3.Infertility experience for at least one year 4.Failure to receive of psychological interventions in the past year
Exclusion criteria: 1.More than two absentee sessions
2.Unwillingness to continue cooperation at any time from the implementation of the research

Intervention groups

In this research, the subjects were divided into intervention and control groups and the questionnaires were filled in by both groups and then the treatment group sessions were conducted for the intervention group and no intervention was performed on the control group, and then the effect of the training before and after the intervention in The two groups were measured and compared.
