Cost-effectiveness of peer education on treatment adherence among elderly hypertensive client

Protocol summary

Study aim

Cost-effectiveness of peer education on treatment adherence among elderly hypertensive clients

Design

Randomized clinical trial

Settings and conduct

This study performed in health center no.3 of Mashhad University of Medical Sciences. At first, samples divided two groups randomly. In intervention group, 45-minute training sessions be held by peers on Blood Pressure Control for six weeks on Saturday for elderly people. During the implementation of the study, the direct costs of implementing peer education included human resource costs, including peer education costs, consumables and estimated training space, as well as the cost of passage and caregiver costs and the cost effectiveness of interventions in relation to the amount of mmHg reduction Blood pressure is calculated. In the control group only routine health care will be held for sixty weekly sessions for 45 minutes by the nurse. in control group direct costs of training sessions held by health center staff are estimated and per mmHg reduction in blood pressure is calculated and compared in intervention group. Blood pressure and Murisky questionnaire and researcher-made questionnaire will be completed before, after the end of the intervention, and three to six weeks later in the both groups.

Participants/Inclusion and exclusion criteria

History of at least 6 months of hypertension; hypertension grade 2 and above; lack of Cyrus hypertension; age 60 and older; ability to speak Persian; reading and writing literacy; treatment with anti hypertensive drugs; Iranian& resident of Mashhad; lack of medical education associated with hypertension over the past 6 months; has suffered from any physical illness or severe mental disorders that prevented the intervention.

Intervention groups

peer education group

Main outcome variables

Comparison of the cost-effectiveness of peer education and routine training

Scientific title
Cost-effectiveness of peer education on treatment adherence among elderly hypertensive client

Public title
Cost-effectiveness of peer education on treatment adherence among elderly hypertensive client

Purpose
Supportive

Inclusion/Exclusion criteria
Inclusion criteria:
The desire to participate in the study History of at least 6 months of hypertension GR1D 2 and higher hypertension Lack of Cyrus hypertension Age 60 and older Ability to speak Persian Literacy reading and writing Treated with anti hypertensive drugs Iranian and resident of Mashhad Lack of physical and cognitive disorder preventing intervention Lack of training in hypertension education over the past 6 months
Exclusion criteria:
Missing more than 1 session at training sessions Deaths of research units Acute illness or hospitalization Unwillingness to cooperate or refuse to attend training sessions

Age
From **60 years** old

Gender
Both

Phase
N/A

Groups that have been masked

- Participant

Sample size
Target sample size: **50**

Randomization (investigator's opinion)
Randomized

Randomization description
Assigned with random spss numbers, in intervention or control groups, randomly

Blinding (investigator's opinion)
Single blinded

Blinding description
Elderly people with Hypertension Grade 2 and above who take anti-hypertensive medications for 6 months are randomly divided into intervention and control groups. While they are in the group, they do not know.

Placebo
Not used

Assignment
Parallel

Other design features

Secondary Ids

Health conditions studied

1

Description of health condition studied

treatment adherence among Elderly Hypertensive client

ICD-10 code

I10

ICD-10 code description

Essential (primary) hypertension

Primary outcomes

1

Description

Cost-effectiveness of peer education

Timepoint

three month after intervention

Method of measurement

Measuring Adherence to treatment using the Murisky scale

Secondary outcomes

1

Description

Adherence to drug treatment

Timepoint

Before intervention, end of intervention, three and six weeks after the end intervention

Method of measurement

Murisky eight-questions questionnaire related to adherence to drug treatment

2

Description

Adherence to diet treatment

Timepoint

Before intervention, end of intervention, three and six weeks after the end intervention

Method of measurement

Researchers' made ten-questions questionnaire related to adherence to diet treatment

Intervention groups

1

Description

Intervention group: first, an elderly person with hypertension who has controlled his or her blood pressure in the last six months, means that there is no systolic pressure greater than 16 years old and has a specific problem associated with hypertension or hospitalization due to HTN. Selected as a peer. Then, 3 sessions of 45 minutes, with the contents of the standard educational package, are communicated by the Ministry of Health regarding the control of blood pressure and its importance in reducing costs. In the intervention group, 45-minute training sessions with standard educational package content are provided by peer group for other elderly once a week for 6 weeks.

Title and more details about the data/document

Evaluating the Effectiveness of Peer Education on Adherence to Treatment of Elderly With Hypertension, Compared to Routine Training

When the data will become available and for how long

Start the access period 6 months after printing the results

To whom data/document is available

Researchers and patients with hypertension

Under which criteria data/document could be used

After collecting data and encoding and logging into the computer, using spss 11 software, data analysis is done using descriptive and inferential statistics. To describe the characteristics of the research units in the two groups, descriptive statistics including frequency distribution and percentages, and central inclination and dispersion, mean, and standard deviations are used. In the analytical statistics, a quantitative data test was performed using Kolmogorov-Smynov and Shapiro Wilk tests. To determine the homogeneity of data in two groups, Chi-square or Fisher test for qualitative variables and independent t-test for quantitative variables and if the abnormality is used, the Mann-Whitney test will be used. Also, intra-group comparisons based on whether data are normal or not, paired t-test or Kruskal-Wallis tests will be used. To determine the relationship between the underlying and interventional variables, two groups of variance analysis or covariance analysis will be used in three groups. To compare the cost-effectiveness of the two methods of peer-to-peer training, with the help of a statistic expert, Tree Age's decision tree model and software will be used. For all tests, the confidence coefficient will be 95%

From where data/document is obtainable

Faculty of Nursing and Midwifery, Ibn Sina Avenue, Doktora st. Mashhad, Iran Phone: 0098 5138591511 Fax: 0098 5138597313 Zip Code: 9137913199 E-mail: NMS.IT@mums.ac.ir

What processes are involved for a request to access data/document

Referring to the library of Mashhad Nursing and Midwifery Faculty and presenting the identification card to this unit and receiving the existing documentation
