The effect of hybrid knee brace on coping ability and neuromuscular parameters after acute anterior cruciate ligament tear

Protocol summary

Study aim

The effect of hybrid knee brace, consisting of a functional brace and an elastic sleeve, after acute rupture of ACL, on coping ability and neuromuscular parameters after acute injury of the anterior cruciate ligament.

Design

Clinical trial with community based and practice-oriented test and control group, with parallel groups, single-blind, simple randomization method

Settings and conduct

Sampling at Shafa Yahyaiyan Hospital, evaluation at the Sport Sciences Research Institute of Iran by the Biodex system 4 dynamometer and relevant questionnaires, tests include maximum muscle strength of the quadriceps, then 30% and 50% of MVC for assessing steadiness of Quadriceps, duration of 6-meter single-leg hop test will be recorded, one-way blindness

Participants/Inclusion and exclusion criteria

Inclusion criteria: people between 18 to 40 years old; unilateral and isolated ACL rupture; maximum three months after injury; 3-5 grade of the Tegner Questionnaire; no cartilage damage; lack of fracture or dislocation; no history of fracture and previous surgery in the knee joint; no history of previous ACL or meniscal or other ligaments injuries. Exclusion criteria: unwillingness to continue cooperation; failure to comply with the rehabilitation protocol; knee pain and inflammation during the performance tests.

Intervention groups

Samples allocation from patients with complete anterior cruciate ligament rupture referring to the knee clinic at Shafa Yahyayan Hospital. The intervention in the test group includes a custom knee brace fabricated by taking measures of the individual's body, plus an appropriate size of sleeve, In the control group, there is no orthosis intervention, and people receive only physical therapy.

Main outcome variables

Coping condition of patients; Tampa questionnaire score; duration of a six-meter hop test; steadiness of the sub

maximal muscular force of the quadriceps

General information

Reason for update

The start and end dates of patient recruitment and the end date of the clinical trial were recorded.

Scientific title
The effect of hybrid knee brace on coping ability and neuromuscular parameters after acute anterior cruciate ligament tear

Public title
The effect of hybrid knee brace on acute anterior cruciate ligament tear

Purpose
Supportive

Inclusion/Exclusion criteria
Inclusion criteria:
Unilateral isolated tear of anterior cruciate ligament
Injury within last three month Required 3-5 scores from Tegner questionnaire
Exclusion criteria:
The presence of damage to the meniscus confirmed by MRI
The presence of cartilage damage
The presence of fracture or dislocation with ACL rupture
The history of fracture and previous surgery in the knee joint
The history of previous ACL or meniscal or other ligaments injuries

Age
From **18 years** old to **40 years** old

Gender
Both

Phase
N/A

Groups that have been masked

- Participant
- Care provider

Sample size
Target sample size: **26**
Actual sample size reached: **26**

Randomization (investigator's opinion)
Randomized

Randomization description
In this study, simple randomization method will be used. 26 cards, numbered from 1 to 26, are poured into the container. Then, each time, a card containing one number is randomly taken out of the container. In this way, 13 cards are selected and the registration number is considered as the numbers of test group. The remaining numbers in the container are considered as the control group. Subsequently, people entering the study according to inclusion criteria are randomized in the test or control group, respectively.

Blinding (investigator's opinion)
Single blinded

Blinding description
In this study, blindness is done in one direction. So that the participants in the study do not know if they are in the control or test group. A specialist physician who will evaluate and refer patients will also be blind.

Placebo
Not used

Assignment

Parallel

Other design features
So far, a study based on orthosis intervention in the acute stage of the anterior cruciate ligament rupture has not been done to increase the number of copers. The result of the present study may increase the number of copers and reduce the likelihood of reconstruction surgery. Another aspect of this study is introducing a hybrid brace that benefits from the use of hard and soft braces simultaneously and also changes in the structure of the hard part for specific instability control after anterior cruciate ligament rupture. Finally, the effect of using the hybrid brace is evaluated by measuring the quadriceps steadiness, which indicates the level of coordination of the musculoskeletal system after the intervention.
