The effect Movement-Pattern Training on pain, muscle activity response and selected landing kinematic variables in people with Non-specific chronic low back pain

Protocol summary

Study aim

The effect Movement Pattern Training on pain muscle activity response and selected landing kinematic in men With (CLBP).

Design

patients with chronic low back pain were randomized into a treatment (MPT) group or a control (wait-list) group. The MPT program included 6 one-hour supervised sessions and incorporated (1) task-specific training for basic functional tasks and symptom-provoking tasks, and (2) strengthening of hip musculature. With parallel groups, a blind strain was performed on 50 patients. The control (wait-list) group received no treatment.

Settings and conduct

subjects performed will 0.30-m single leg landings. Trunk muscle activity will assessed using a 8-lead EMG set-up. Knee kinematics will measured using a Electrogoniometer for extension-flexion, Addaction and Abdaction were calculated of the during landing. The assessments will completed in pre-test and after six weeks.

Participants/Inclusion and exclusion criteria

Inclusion criteria included:Low back pain more than three months;Exclusion criteria for group were: spondylolisthesis or spondylolysis, ankylosing spondylitis, moderate to severe spinal osteoarthritis, inflammatory arthritis, physically active, nerve root compression, trunk neuromuscular disease, scoliosis (15° or more), previous spinal surgery, malignant tumour, hypertension. degenerative or inflammatory diseases of the lumbar spine. Subjects were excluded if they had received specialized training in jumping and landing techniques, such as through participation in gymnastics or dance

Intervention groups

wxpremental group:The MPT program included 6 one-hour supervised sessions and incorporated (1) task-specific training for basic functional tasks and symptom-provoking tasks, and (2) strengthening of hip

musculature. control group: trunk muscle activity, pain, and kinematics of landing during single leg landing

Main outcome variables

Decrease low back pain

Sample size

Target sample size: **60**

Actual sample size reached: **35**

Randomization (investigator's opinion)

Randomized

Randomization description

Simple randomization Following the initial screening and collection of labs, all study subjects started therapy within 3 days of baseline measurements. A study investigator, who did not perform any clinical measurements on study subjects, used a coin-flip to randomly assign study subjects to either the experimental control groups.

Blinding (investigator's opinion)

Single blinded

Blinding description

Data Analyzer were blind before and after the experiment. In a way that did not explain to them which control group and which experimental group

Primary outcomes

1

Description

Visual Analogue Scale

Timepoint

Before intervention, after 45 days after intervention, 45 days after the intervention

Method of measurement

Pain Quebeck Questionnaire

2

Description

Landing degree

Timepoint

Before intervention, after 45 days after intervention, 45 days after the intervention

Method of measurement

Electrogiametr

3

Description

muscle response

Timepoint

Before intervention, after 45 days after intervention, 45 days after the intervention

Method of measurement

Electromyography

Secondary outcomes

1

Description

Intervention group: The movement pattern exercises are taught in the first week of the correct training of movements in everyday activities, including walking, sitting, standing, walking up and down, and proper daily routine exercises, and from the second to the fourth week of the boost muscle, each The exercises have 5 steps from easy to hard. If you do not have a feeling of pain, you should do the 4 th and 5 th steps using Teraband, which include (20 to 10 repetitions of 2 sets), the second week to strengthen the flexors, Third week strengthen the extensor muscles of the thigh, fourth week strengthen muscle of the abductor, fifth week, strengthen the muscles of the catheter, And the sixth week to strengthen the complexion of the thigh muscles

Timepoint

After the test steps for 45 days

Method of measurement

Movement pattern training

2

Description

Without intervention - Based on ethics in research after the end of interventions for such as intervention group

Timepoint

For 45 days after the end of the interventions

Method of measurement

Movement pattern training

Intervention groups

1

Description

Intervention group: All the intervention group underwent a total of 21 supervised training sessions, over a 6-week period The MPT program incorporated 2 primary components, including (1) task-specific training for basic functional tasks 6 supervised in the week 1 For the task-specific training, all patients received standard instructions, to optimize their movement pattern during basic daily tasks, such as ascending stairs and sit to stand. (2): 2-6 weeks: Strengthen thigh muscles.
