Comparison of the effect of patient safety management training using flipped classroom method by near peer group and common method on the durability of nursing and midwifery students' knowledge in Bushehr university of Medical Sciences in 2019

Protocol summary

Study aim

Determining and comparison of the effect of patient safety management training using flipped classroom method by near peer group and common method on the durability of nursing students' knowledge retention

Design

Semi-experimental with pre-test and post-test design with control group. Four Solomon groups are used in this study; randomized.

Settings and conduct

This study will be conducted by nursing and midwifery students of Bushehr University of Medical Sciences.

Participants/Inclusion and exclusion criteria

Inclusion criteria: access to a computer or smartphone; tending to participate in research. Exit criteria: absence in the classroom; not viewing educational content.

Intervention groups

During one session, the description of the method of work and the purpose of doing it for the students and obtaining written informed consent from them, as well as taking the pre-test from the intervention and control groups 1 in this session. First, the control group will provide the patient's safety management training in a conventional way (a workshop approach at a 6-hour session) by the relevant teacher, and then during a session, the two intervention intervention groups will be presented as flipped classroom method by near peer group; the teacher (near peer) to teach the reverse engineering class of the educational content of patient safety management and to download it electronically 2 weeks before the start of the class on the website to be provided to the two intervention groups. There are standard clinical concepts for concepts in the classroom. And learners in the classroom by analyzing and answering related questions Clinical scenarios become familiar with the application of theoretical knowledge in

clinical settings.

Main outcome variables

Increasing the thought of learning patient safety in students; improve patient safety; helping to shorten the nursing faculty members

Sample size

Target sample size: 80

Randomization (investigator's opinion)

Randomized

Randomization description

Sampling is complete and based on the purpose and then the random allocation, which students are randomly divided into four groups of 22 people using the blocking method (four-group Solomon plan). The researcher randomly divided the two groups into an intervention group (intervention group 1 and intervention group 2) and the other two groups as control group (control group 1 and control group 2).

Blinding (investigator's opinion)

Not blinded

Assignment

Parallel

Other design features

In this research, four groups of Solomon are used. The researcher randomly divided the two groups into an intervention group (intervention group 1 and intervention

group 2) and the other two groups as control group (control group 1 and control group 2). Only the intervention group (1) and the control group (1) are pre-test, and then from each of the four groups, the post-test is immediately and two months after the training.

Knowledge Retention

Timepoint

Pre-test pre-intervention and post-test immediately after intervention and knowledge-durability test two months after intervention

Method of measurement

Examination of four questions related to patient safety (researcher-made)

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: Intervention 1. Obtain a pre-test before intervention and continue to provide online safety management training online for two weeks and continue to hold the classroom as a reciprocal class by close counterpart with the design of clinical scenarios and taking post-test immediately after intervention And two months later

Category

N/A

2

Description

Intervention group: Intervention 2. No pretest. Initially provide the online safety management training content online for two weeks and continue the classroom reciprocity by close counterpart with clinical scenario design and post-test taking immediately after the intervention and two months later.

Category

N/A

3

Description

Control group: Control 1. Getting a pre-test and continuing the workshop on patient safety management by the corresponding teacher and taking the post-test immediately after the class and two months later.

Category

N/A

4

Description

Control group: Control 2. Pre-test and continue the workshop on safety management of the patient by the relevant teacher and taking post-test immediately after the class and two months later.
