Iranian Registry of Clinical Trials

10 Jun 2026

Effect of low level laser therapy with 980 nm diode on post endodontic pain after single-visit retreatment in mandibular molars with periapical lesion

Protocol summary

Study aim

The aim of this study is to determine the effect of 980 nm low-power laser on postoperative pain after a single-visit endodontic retreatment in mandibular molar teeth with periapical lesion in patients referred to an endodontic specialized clinic.

Design

This will be a randomized triple blind clinical trial.

Settings and conduct

This will be a randomized triple blind clinical trial. The research is going to take place in Department of endodontics, Faculty of dentistry, Tehran medical sciences, Islamic Azad University, Tehran, Iran.

Participants/Inclusion and exclusion criteria

Patients included in this study were scheduled for RCR on mandibular molars, presented with periapical lesions with scores 2 or 3 in accordance with the periapical index classification introduced by Ørstavik et al, and had a pain VAS <56 and a percussion pain VAS <56. All patients were in good health as determined by health history and verbal questioning. Periodontal probing greater than 3 mm, swelling or sinus tract, and palpation and percussion VAS>56 are the exclusion criterias. Besides, all the teeth that have been diagnosed to be unrestorable after the endodontic retreatment in the primary evaluations, will be excluded from the study.

Intervention groups

Intervention Group: 980 nm low level laser Control Group: Placebo

Main outcome variables

Prevention of post endodontic retreatment pain.

Inclusion/Exclusion criteria

Inclusion criteria:

Patients included in this study were in need of RCR on mandibular molars. They were presented with periapical lesions with scores 2 or 3 in accordance with the periapical index classification introduced by Ørstavik et al. A pain VAS <56. A percussion pain VAS <56. All patients were in good health as determined by health history and verbal questioning.

Exclusion criteria:

Periodontal probing greater than 3 mm. Swelling or sinus tract. Palpation and percussion VAS >56. All the teeth that have been diagnosed to be unrestorable after the endodontic retreatment in the primary evaluations, will be excluded from the study.

Sample size

Target sample size: **18**

Randomization (investigator's opinion)

Randomized

Randomization description

Samples are placed in a randomized 4-block by the method of Balanced block. The randomization process is performed by an individual other than the investigator, and the information about the sample intervention is stored in sealed envelopes in order to randomize in excel software. The envelopes contain 18 items for the case group and 18 for the control group. Patients are divided into two groups according to their age and sex.

Blinding (investigator's opinion)

Triple blinded

Blinding description

The patient is not aware of the research process. The investigator is not aware of the research process. The evaluator is not aware of the research process.

Title and more details about the data/document

A part of the information, such as information on the main outcome, can be shared

When the data will become available and for how long

The start of the access period will be 6 to 12 months after the results are released

To whom data/document is available

Data will only be available to researchers working in academic institutions

Under which criteria data/document could be used

Data will be available for dental research centers, universities and public and private health centers. All clinicians using laser to reduce pain after endodontic retreatment are allowed to use the documentation. Dr. Mahta Fazlyab dr.mfazlyab@gmail.com +982122564571 No. 9, Faculty of Dentistry Islamic Azad University, 9th Neyestan Ave, Pasdaran Ave.
