Comparison of the short-term effect of therapeutic ultrasound and TECAR therapy on hamstring muscle flexibility in healthy athlete men with hamstring shortness: A randomized controlled trial

Protocol summary

Study aim

Comparison of short-term effects of ultrasound therapy and tecar therapy on hamstring flexibility in healthy athlete men

Design

Three parallel group randomised trial with control group with single blinded outcome assessment

Settings and conduct

This research was performed at the School of Rehabilitation in University of Tehran. Individuals divided in three groups of static stretching, ultrasound therapy And tecartherapy. In all groups, assessments were performed immediately before the start of treatment, immediately after the first session, as well as in the third session. The physiotherapist who performs the assessments before and after the sessions is unaware of the grouping of individuals. so this trial is single blind.

Participants/Inclusion and exclusion criteria

1-Inclusion criteria: Athletes who practice at least three two-hour sessions per week. Athletic men aged 20 to 30 years with dominant hamstring muscle shortness. 2- Exclusion criteria: Unwillingness to participate in the study.

Intervention groups

Intervention Group1: Tecartherapy with Static stretching: This group will receive capacitive Tecartherapy for 15 minutes at the frequency of 0.5 MHz and at the intensity of 140 Hz before the static stretch. (Details of stretching are provided in control group) Intervention group2: Ultrasound therapy with static stretching: This group will receive continuous ultrasound therapy at a frequency of 1 MHz and at the intensity of 2 W/cm² and at a speed of 2 cm / s before static stretching for 15 minutes. Control group: static stretch: Stretching is given for 30 seconds. After each stretch, rest for 5 seconds and repeat four times to achieve a total of two minutes. This process is performed

three sessions a week for every other day.

Main outcome variables

flexibility of proximal head of hamstring: flexibility of distal head of hamstring

Scientific title

Comparison of the short-term effect of therapeutic ultrasound and TECAR therapy on hamstring muscle flexibility in healthy athlete men with hamstring shortness: A randomized controlled trial

Public title

Evaluation of the effect of tecartherapy on hamstring muscles shortness

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

20-30 years old shortness of hamstring muscle based on 90-90 test. Men must do exercise 3 times a week and 2 hours in each session.

Exclusion criteria:

Unwillingness to participate in the study contraindication of the TECAR intervention . history of orthopedic and neurological injuries in the lower extremities in last 6 month. Acute low back pain and low back problems

Age

From **20 years** old to **30 years** old

Gender

Male

Phase

N/A

Sample size

Target sample size: **30**

Actual sample size reached: **30**

Randomization (investigator's opinion)

Randomized

Randomization description

Each individual were included in one of the TECAR therapy or ultrasound therapy or static stretching groups by simple randomization method (using the dice throw method). By throwing dice the numbers 1 and 2 fall into group 1 (TECAR therapy), and the numbers 3 and 4 fall into group 2 (ultrasound) and the numbers 5 and 6 fall into group 3 (static stretch).

Blinding (investigator's opinion)

Single blinded

Blinding description

A physiotherapist who performs pre-treatment evaluations, at the end of the first session, and at the end of the third session will not be aware of the type of treatment's group. treatment will be performed by the second physiotherapist.

Health conditions studied

1

Description of health condition studied

Shortness of Hamstring Muscle

ICD-10 code

ICD-10 code description

Primary outcomes

1

Description

Flexibility of Distal Head of Hamstring Muscle

Timepoint

Before treatment , Immediately after the first session , Immediately after the third session (Intervention sessions take place 3 days in a week)

Method of measurement

Passive 90-90 test , Active 90-90 test

Secondary outcomes

1

Description

Flexibility of Proximal Head of Hamstring

Timepoint

Before treatment , Immediately after the first session , Immediately after the third session (Intervention sessions take place 3 days in a week)

Method of measurement

Sit and Reach Test

Intervention groups

1

Description

Intervention Group 1: Tecartherapy with Static stretching: This group will receive capacitive Tecartherapy for 15 minutes at the frequency of 0.5 MHz and at the intensity of 140 Hz before the static stretch, with the passive electrode plate size 230×170 mm, and the active electrode is 5 cm² on the hamstring muscle group for 3 sessions in a week every other day. (Details of stretching are provided in control group)

Category

Rehabilitation

2

Description

Intervention group 2: Ultrasound therapy with static stretching: This group will receive continuous ultrasound therapy at a frequency of 1 MHz and at the intensity of 2 W/cm² and at a speed of 2 cm / s before static stretching (details of stretching in the control group) for 15 minutes on the hamstring muscle group in a relaxed situation for 3 sessions in a week every other day. For this reason, the patient is placed on a prone position. (Details of stretching are provided in control group)

Category

Rehabilitation

3

Description

Control group: static stretch: The individual is in a supine position and the hip and knee joints are stretched at 90 degrees flexion. To prevent posterior pelvic tilt and lumbar flexion, the pelvis is fixed. For this reason, the opposite leg is pushed down by the examiner. The examiner gently lifts the person's knees to straighten the knee to reach the end point of the range of motion and feel stretched under his arm. Stretching is given for 30 seconds, very slowly, gently and gradually to prevent stimulation of stretch reflex and increase muscle tone. After each stretch, rest for 5 seconds and repeat four times to achieve a total of two minutes. This process was performed for 3 sessions in a week every other day.

Title and more details about the data/document

Only part of the data, such as information about the main outcome, can be shared.

When the data will become available and for how long

One year after the results were published

To whom data/document is available

Available to all physiotherapists.

Under which criteria data/document could be used

No more conditions.

From where data/document is obtainable
