

Clinical Trial Protocol

Iranian Registry of Clinical Trials

10 Jun 2026

The effect of high power laser with exercise versus sham high power laser with exercise versus high power laser on pain, grip strength and function in patients with chronic lateral epicondylitis.

Protocol summary

Study aim

To evaluate the effect of high power laser in lateral epicondylitis

Design

A randomized, double blinded, sham controlled clinical trial with 3 parallel groups of about 75 participants.

Settings and conduct

This study will be conducted in physiotherapy clinic of Iran Rehabilitation School. Participants will randomly assigned to 3 groups after filling out the consent and collecting information forms. Participants and the assessor will be blinded about the groups. Evaluation will be done before treatment and at the end of the first, fifth, tenth sessions and after 3 months follow up. Intervention in the all groups includes 1 warm up session and 10 treatment sessions every other day(3 per week). After 10 treatment sessions the data will be analyzed.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Pain at/around the lateral epicondylitis that exacerbates by gripping; age between 35 -55 years; symptoms duration between 3-6 months; 2 of 3 positive result of provocative tests comprising Mill`s, Maudsley`s and Cozen`s tests; tenderness on palpation of lateral epicondyle Exclusion Criteria: cervical radiculopathy; neuropathy; myelopathy; any type of treatment for example: drugs; local injection and physiotherapy with in the past 3 months; upper limb surgery; deformity and fractures of elbow joint bones; pregnancy; rheumatic diseases and photo sensitivity

Intervention groups

The intervention group NO.1 will receive high power laser with exercise, the intervention group NO.2 will receive high power laser and the control group will receive sham high power laser with exercise and the effect of high power laser, high power laser with exercise and exercise on chronic lateral epicondylitis will be studied and compared.

Main outcome variables

The pain; hand grip and function

Scientific title
The effect of high power laser with exercise versus sham high power laser with exercise versus high power laser on pain, grip strength and function in patients with chronic lateral epicondylitis.

Public title
The effect of high power laser in chronic lateral epicondylitis

Purpose
Treatment

Inclusion/Exclusion criteria
Inclusion criteria:
History of the symptoms between 3 to 6 months Exacerbating the pain on lateral aspect of elbow by gripping 2 of 3 positive results of Mills-Cozen and Maudsley tests Tenderness with palpation of lateral epicondylitis
Exclusion criteria:
Cervical radiculopathy, neuropathy and myelopathy Any type of treatment; drugs, local injections and physiotherapy within the past 3 months History of upper extremity surgical treatment Deformity and fractures of the humerus and elbow joint bones Pregnancy Rheumatic disease Photosensitivity

Age
From **35 years** old to **55 years** old

Gender
Both

Phase
N/A

Groups that have been masked

- Participant
- Outcome assessor

Sample size
Target sample size: **75**

Randomization (investigator's opinion)
Randomized

Randomization description
Method: simple - unit: personal- by using sealed envelope Participants will be randomly assigned to 3 groups(intervention NO1.; intervention NO2. and control groups) by drawing a sealed envelope in which the number of one of the groups is written from a box. After completing a group it`s envelope will be put away.

Blinding (investigator's opinion)
Double blinded

Blinding description
The participants will be unaware of classification and to prevent of the participants communication, timing will arrange carefully. In the control group, the Laser set will be off. Assessor will be kept unaware and will be asked to do just evaluation and abstain of any answer and question.

Health conditions studied

1

Description of health condition studied
Chronic Lateral Epicondylitis
ICD-10 code
M77.10
ICD-10 code description
Chronic Lateral Epicondylitis

Primary outcomes

1

Description
Pain
Timepoint
Before warm up session ,at the end of the first, fifth, tenth sessions and after 3 months
Method of measurement
VAS=visual analog scale

Secondary outcomes

1

Description
Hand grip strength
Timepoint

Before warm up session, at the end of first, fifth, tenth, sessions and after 3 months follow up

Method of measurement

Dynamometer

2

Description

Function

Timepoint

Before warm up session; at the end of first; fifth; tenth sessions and after 3 months follow up

Method of measurement

PRTEE Questionair= Patient Rated Tennis Elbow Evaluation

Intervention groups

1

Description

In the intervention group NO.1, intervention includes high power laser therapy and exercise. The laser parameters are: power 7 W.; energy dose 10 j/cm²; duty cycle 50%. In the first session that is a warm up the laser dose will be 5 j/cm² and in the next ten sessions the laser dose will be 10 j/cm². Subjects will be evaluated before the warm up; at the end of the first; fifth; tenth sessions and after 3 months follow up. During the each session, in sitting position, elbow in extension and forearm in pronation after safety precautions the treatment area will be demarcated then the laser probe will be moved along the long axis and transverse to the tendon. Exercise includes static stretching followed by eccentric exercise of wrist extensors. Stretching exercise will be performed in seated position with elbow extension and forearm pronation and wrist flexion with ulnar deviation. Stretch force will be applied by therapist according to the participant tolerance for 30 to 45 seconds and 3 times before and 3 times after eccentric exercise with 30 seconds rest between each stretch. Eccentric exercise will be performed in the seated position with elbow extension, forearm pronation and maximum wrist extension. Then the participant slowly will lower the wrist in to the flexion for a count of 30. Using the contralateral hand to return to the started position. 3 set of 10 repetition will be performed during each session with a one minute rest interval between each set for 10 sessions every other day.

Category

Treatment - Other

2

Description

Intervention group NO.2: This group receives high power laser(with the protocol as mentioned in group NO.1(laser power 5W; laser dosage 5J/CM² in the warm up session and 10J/cm² in the 10 treatment sessions)without exercises. Due to ethical considerations subjects will be offered the exercise after 3 months follow up.

Category

Treatment - Other

3

Description

Control group: In this group the laser unit will be off and the exercise program will be performed as the program in the intervention group NO.1. Due to ethical considerations the subjects will be offered the true treatment after 3 month follow up.
