The effect of combined pelvic floor treatments on sexual function, pelvic floor muscle strength and endurance in women with chronic low back pain at two different levels of fear of pain

Protocol summary

Study aim

The effect of combined pelvic floor treatments on sexual function, strength and pelvic floor muscle endurance in two groups of women with nonspecific chronic low back pain at two different levels of fear of pain

Design

Clinical Trial, with parallel groups, double-blinded, simple-randomization with random numbers table

Settings and conduct

Volunteers with nonspecific chronic low back pain at IRAN Mehr Physiotherapy Center in shahrood entered the study after completing the consent and demographic form. Then randomly divided into 4 groups: high fear of pain and control, low fear of pain and control. The treatment plan includes 10 sessions of combined electromyographic biofeedback, functional electrical stimulation and progressive pelvic floor exercises once a week for a total of three months

Participants/Inclusion and exclusion criteria

Inclusion criteria; Age between 20 and 50 years
Having recurrent low back pain for 12 weeks or more
VAS less than 3 Sexual dysfunction based on FSFI questionnaire score lower than 26.55
Exclusion criteria;
Any symptoms of serious spine involvement
Pregnancy
Psychological and mental diseases
Neurological diseases
Respiratory and metabolic diseases
Gynecological Diseases

Intervention groups

First group: High fear of pain treated with 10 sessions of combined pelvic floor rehabilitation (electromyographic biofeedback, functional electrical stimulation) with neuro track device and progressive pelvic floor muscle training
Second group: Low fear of pain treated with 10 sessions of combined pelvic floor rehabilitation (electromyographic biofeedback, functional electrical stimulation) by neuro track device and progressive pelvic floor muscle training
control groups without intervention

Main outcome variables

Pelvic floor muscle strength: Pelvic floor muscles endurance: Female sexual function index questionnaire score: Fear of pain Questionnaire score

Scientific title

The effect of combined pelvic floor treatments on sexual function, pelvic floor muscle strength and endurance in women with chronic low back pain at two different levels of fear of pain

Public title

Pelvic floor treatment on pelvic floor muscle strength

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Age between 20 and 50 years Recurrent low back pain for 12 weeks or more VAS less than 3 Female sexual dysfunction based on FSFI questionnaire score lower than 26.55

Exclusion criteria:

Serious spine involvement Symptoms of the cauda equina syndrome Pregnancy Neurological disorders Mental disorders Respiratory and metabolic diseases Gynecological Diseases

Age

From **20 years** old to **50 years** old

Gender

Female

Phase

Groups that have been masked

- Investigator
- Outcome assessor

Sample size

Target sample size: **48**

Randomization (investigator's opinion)

Randomized

Randomization description

Simple randomization with a random number table such that each person is given a code and they are written in a table. we select one place from the table in a blinded manner, then we select 12 numbers smaller than the selected number in the same row. The same would be true for the second treatment and control group

Blinding (investigator's opinion)

Double blinded

Blinding description

The researcher will be blind to the intervention using the research assistant and he/she is absent in the treatment room The outcome evaluator will vary with the researcher and research data be given him with code and is unaware of the participants' intervention

Placebo
