

Clinical Trial Protocol

Iranian Registry of Clinical Trials

27 Jul 2026

Comparison between sinus augmentation with Platelet-Rich Fibrin versus Allogeneic Bone Grafts in stability of one stage implant placement

Protocol summary

Study aim

Comparison of platelet rich fibrin and allogenic bone graft on implant stability

Design

The study will be designed as a double-blind split mouth randomized clinical trial . Samples will be selected from those referred to Qazvin Dental School. 10 patients who need bilateral maxillary sinus agitation will be included in the study after obtaining informed consent

Settings and conduct

Sinus lift in each patient will be performed on both sides laterally using TOLA SINUS KIT. To strengthen the membrane on one side of platelet rich fibrin and the opposite side of collagen membranes Placed. The implants will then be implanted with the same length and diameter on both sides.2 blind Examiners will be selected for stability measurement Stability will be measured by resonance frequency analysis (RFA) method. RFA will be measured immediately after implant placement and 2, 4 and 6 months after implantation and will be compared on both sides.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Patients who need bilateral sinus augmentation.They had to have adequate inter-occlusal and mesiodistal space and sufficient bone width and height . Exclusion criteria: if they were diabetic or had a disease that affects bone metabolism, had a history of previous bone graft or sinus lift, had used immunosuppressive drugs or corticosteroids, or had a history of radiotherapy or chemotherapy.

Intervention groups

Schneiderin membrane lift will be performed on 2 sides to strengthen the membrane on one side of the PRF and on the opposite side of the collagen membranes. The same (diameter 4.5 and length 12) will be installed on both sides. Then the holding abutment will be closed on both sides and followed by suturing.

Main outcome variables

1.Evaluate bone healing time 2.evaluate patient cost if

treatment is effective

Scientific title
Comparison between sinus augmentation with Platelet-Rich Fibrin versus Allogeneic Bone Grafts in stability of one stage implant placement

Public title
Platelet-Rich Fibrin versus Allogeneic Bone Grafts in stability of one stage implant placement

Purpose
Treatment

Inclusion/Exclusion criteria
Inclusion criteria:
Patients who need bilateral sinus augmentation patients with adequate interocclusal and mesiodistal distance for implant placement adequate width for implant placement 5 mm residual bone in each side
Exclusion criteria:
diabetic patients patients with history of bone grafts immunosuppressive patients and corticosteroid users patients with history of chemotherapy or radiotherapy

Age
From **30 years** old to **65 years** old

Gender
Both

Phase

Groups that have been masked

- Investigator

Sample size
Target sample size: **10**

Randomization (investigator's opinion)
Randomized

Randomization description
Simple individual randomization with sealed envelope and random allocation

Blinding (investigator's opinion)
Double blinded

Blinding description
The double-blind study is designed so that the examiners and statisticians are blind to the two study groups.

Placebo
Not used

Health conditions studied

1

Description of health condition studied

Implant stability measurement

ICD-10 code

ICD-10 code description

Primary outcomes

1

Description

stability

Timepoint

Immediately after surgery and 2, 4 and 6 months later

Method of measurement

Stability: With ostell device, the degree of stability (ISQ) is measured based on resonance frequency analysis.

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: Patients receive 2 grams of amoxicillin prophylactically one hour before surgery. After injection of Local anesthesia, a crystal incision is placed with an anterior releasing incision on both sides of the maxilla. The complete mucoperiosteal flap is removed. Lateral should be created with complete safety and as much as possible without perforation of Schneiderian membranes. Then Schneiderian membrane lift will be performed on 2 sides. On the PRF side is the PRF plug. Then the implants with the same length and diameter (diameter 4.5 and length 12) from BIOTECH brand (kontakt biotech dental implant, France with standard protocol according to the manufacturer's guideline with a speed of 800 rpm and a crack of 20 N will be installed on both sides. After surgery, the patient will be advised to use a cold compress at the surgical site and the antibiotic Ko Amoxiclav 375 mg in 20 pieces and gelofen analgesic and chlorhexidine mouthwash 0.12 % Will be prescribed for one week.

Treatment - Surgery

2

Description

Control group: All patients receive 2 grams of amoxicillin prophylactically one hour before surgery. After injection of Local anesthesia, a crystal incision is made with an anterior releasing incision on both sides of the maxilla. The complete mucoperiosteal flap is removed. The sinus lift in each patient is performed laterally on both sides using the TOLA SINUS KIT until the window. Lateral with complete safety and as much as possible without perforation of Schneiderian membranes, then Schneiderian membrane lift will be performed on 2 sides to strengthen the membrane on the opposite side of CENO BONE collagen membranes with a thickness of 0.2-0.6 mm with dimensions of 20 * 20 mm. FDBA bone powder is placed with a particle size of 500-1000 µm, then the implants with the same length and diameter (diameter 4.5 and length 12) will be installed according to the standard protocol according to the manufacturer's guideline with a speed of 800 rpm and a crack of 20 N on both sides. The abutment will be closed on both sides, followed by a suture. After surgery, the patient will be advised to use a cold compress at the surgical site and will be prescribed the antibiotic Co Amoxiclav 375 mg in 20 pieces and gelofen analgesic and 0.12% chlorhexidine mouthwash for one week.
