

Clinical Trial Protocol

Iranian Registry of Clinical Trials

10 Jun 2026

The effect of atropine on prevention of vasovagal syncope before spinal anesthesia

Protocol summary

Study aim

Because vasovagal shock can occur as a result of seeing unpleasant scenes and the patient falls heavily on the ground and suffers physical injury and, on the other hand, with severe cardiac arrest and slowing heart rate has unpleasant consequences for the heart, it is controlled. Can be helpful.

Design

A randomized, double-blind, placebo-controlled clinical trial

Settings and conduct

This study is a double blind clinical trial that will be conducted in Khatam Al-Anbia Hospital of Shahroud in 1389-99.

Participants/Inclusion and exclusion criteria

conditions for entering: Patient's informed consent to participate in the study ASA II,III Female or male aged 15 to 60 years conditions for exiting: People's unwillingness to participate in the study History of heart disease History of hypertension medications such as propranolol History of cigarette alcohol abuse and any drug abuse History of neurological disease

Intervention groups

It is designed to evaluate the prophylactic effect of atropine from vasovagal syncope before spinal anesthesia.

Main outcome variables

1. Determination of the association between vasovagal syncope and atropine injection in pre-regional anesthesia by age
2. Determination of the association between vasovagal syncope and atropine injection in pre-regional anesthesia by sex
3. Determination of the association between vasovagal syncope and atropine injection in pre-regional weight loss stage
- 4- Determination of the association between vasovagal syncope and atropine injection in pre-regional anesthesia according to blood pressure
5. Determination of the association between vasovagal syncope and atropine injection in pre-regional anesthesia in terms of phlebotomy rate
6. Determine the

relationship between people's extreme fear of needles and the occurrence of vasovagal syncope
