Comparison of the effect of eight weeks plyometric training program on different levels on balance, strength and functional movement of lower extremity non-athletic girls with ankle sprain

Protocol summary

Study aim

Comparison of the effect of eight weeks plyometric training program on different levels on balance, strength and functional movement of lower extremity non-athletic girls with ankle sprain

Design

Subjects were divided into 3 groups of 10 control, experimental hopping and experimental dip jump. Subjects will be selected after completing the Cumberland Ankle Functional Instability Questionnaire form.

Settings and conduct

Eight weeks of plyometric training is provided with both the Hoping and Deep Jump training protocols at the gym. Then, to evaluate the subjects before and after the training period, the Y balance tests were used to evaluate the balance, vertical jump test was used to evaluate the low explosive power of the trunk, and the tri-leap, lateral jump and 8-jump jump tests. The lower extremity motor function of subjects is used.

Participants/Inclusion and exclusion criteria

Entry requirements: Non-participation in sports for the past 2 years, age range between 18-30 years and ankle sprain experience in the past six months Exclusion criteria: Physician's diagnosis of non-jumping exercises, injuries other than ankle sprains, other lower extremity injuries

Intervention groups

Intervention groups included control group, Hoping group and Deep jump group. Eight weeks of Hoping Exercise 3 sessions per week with a range of 70 to 130 foot contact volume training in the Hoping Experimental group, and eight weeks of Deep Jump training and 3 sessions of 1 hour per week for the Deep Jump Experimental group. . The control group will start their daily life during these eight weeks.

Main outcome variables

Both exercises may improve balance, strength, and lower extremity motor function, and may be used to rehabilitate and improve ankle sprains and return to daily activities.

Scientific title
Comparison of the effect of eight weeks plyometric training program on different levels on balance, strength and functional movement of lower extremity non-athletic girls with ankle sprain

Public title
Comparison of the effect of eight weeks plyometric training program on different levels on balance, strength and functional movement of lower extremity

Purpose
Supportive

Inclusion/Exclusion criteria
Inclusion criteria:
Failure to participate in sports activities for the past 2 years Ankle sprain experience in the last six months Age range between 18-30 years
Exclusion criteria:
Physician's diagnosis of non-movement and jumping exercises Having injuries other than ankle sprains Other injuries to the lower limbs

Age
From **18 years** old to **30 years** old

Gender
Female

ICD-10 code description

Primary outcomes

1

Description

Balance, Power and Motor function Lower extremity

Timepoint

Before the start of the training period - 2 days after the end of the training period

Method of measurement

Y balance test for balance evaluation, vertical jump test for low trunk explosive power test, and triple jump, lateral jump, and figure 8 jump tests to evaluate lower extremity motor function.

Secondary outcomes

empty
