Comparison of Subtalar Mobilization with Conventional Physiotherapy Treatment for the Management of Planter Fasciitis

Protocol summary

Study aim

To compare the effectiveness subtalar mobilization with mulligan technique on pain and functional limitations versus conventional physiotherapy in patients with Planter Fasciitis

Design

Two arm parallel group randomised trial with blinded postoperative care and outcome assessment

Settings and conduct

The data was collected from Prime Care Hospital, Faisalabad. The patients were divided into two groups by using card allocation method. In group-A patients were treated with subtalar mobilization with Mulligan Technique and in group-B patients were treated with Convention physiotherapy treatment that were include a session of therapeutic Ultrasound for 10 minutes. Patients in both the groups received rigid tapping as standard treatment. Each Patient receives two treatment sessions per week with maximum eight treatment sessions over the period of 3 weeks.

Participants/Inclusion and exclusion criteria

Inclusion Criteria Age 30–60 years. Patients of both Genders Main presenting complaint of Heel & Foot pain Limitation of Range of Motion at ankle joint due to heel pain Pain allocated at the bottom of heel and produced by pressure Pain in the morning at first steps or after prolonged non-weight bearing Exclusion criteria History of trauma, acute and chronic pathology Patients with any Systemic Illness (e.g. Rheumatism)• Fracture below knee during the last year Prior foot surgeries

Intervention groups

n group-A patients were treated with subtalar mobilization with Mulligan Technique and rigid tapping as standard treatment. Each Patient receives two treatment sessions per week with maximum 6 treatment sessions over the period of 3 weeks.

Main outcome variables

Outcomes were measured by Visual Analogue Scale and Foot & Ankle Disability Index at baseline, after 1st and

2nd week and at the end of the treatment.

Randomization (investigator's opinion)

Randomized

Randomization description

Participants were randomly assigned following simple randomization procedures (computerized random numbers) to 1 of 2 treatment group

Blinding (investigator's opinion)

Single blinded

Blinding description

The study was single-blinded as assessors of the study was blinded of the treatment group to which the patient will be allocated.

Health conditions studied**1****Description of health condition studied**

PLANTER FASCIITIS

ICD-10 code

M79.671

ICD-10 code description

Heel pain, plantar fasciitis, subtalar mobilization, manual therapy, rigid taping.

Primary outcomes**1****Description**

Pain

Timepoint

Baseline and on 1 and 2 week and end of intervention

Method of measurement

Visual Analogue Scale

2**Description**

Foot and Ankle Functional Limitations

Timepoint

Baseline and on 1 and 2 week and end of intervention

Method of measurement

Foot and Ankle Disability Index

Secondary outcomes

empty

Intervention groups**1****Description**

Intervention group: will get subtalar mobilization (Mulligan Technique) +rigid tapping as standard

treatment for 40 minutes of session. Each Patient receives two treatment sessions per week over the period of three weeks.

Category

Rehabilitation

2

Description

Control group: will get subtalar conventional physiotherapy +rigid tapping as standard treatment for 40 minutes of session. Each Patient receives two treatment sessions per week over the period of three weeks.
