EEG-based emotion recognition during visual learning process in healthy females

Protocol summary

Study aim

Comparison of EEG signals before and after visual learning process corresponding to emotions experienced by individuals during the learning, in order to design an emotion recognition system during learning using brain signals.

Design

Quasi-experimental clinical trial, Before-after design, One intervention group with 20 healthy subjects.

Settings and conduct

This study focuses on recognizing emotions involved in the learning process using biological signals, at Tarbiat Modares University of Iran. The procedure: 1. Identifying individuals with visual learning style to participate in the experiments, using a psychological personality questionnaire, 2. EEG signal acquisition from the participants before and during the visual learning process, 3. Evaluating the learning performance of the subjects based on a written test, 4. Assessing emotions experienced by the subjects during the learning process based on self-report questionnaires, 5. Assigning subjects to two groups of with effective learning (good learning with positive emotions according to stage 3 and 4, respectively) and with ineffective learning (poor learning with negative emotions according to stage 3 and 4, respectively), 6. Within-group and between-group comparison of recorded EEG signals before and during the learning process, to design an EEG-based emotion recognition system. In this step, we will focus on statistical analysis and classification methods.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Female, aged between 25 to 31 years, healthy individuals, university-graduated or student, visual learning style. Exclusion criteria: History of mental disorders, medication use, visual impairment, hearing impairment.

Intervention groups

Intervention group: A visual learning task, while recording EEG signals.

Main outcome variables

Brain neural activity

Scientific title

EEG-based emotion recognition during visual learning process in healthy females

Public title

Emotion recognition during learning process using brain signals

Purpose

Supportive

Inclusion/Exclusion criteria**Inclusion criteria:**

Aged between 25 to 31 years Healthy individuals
University-graduated or student Visual learning style

Exclusion criteria:

History of mental disorders Medication use Visual impairment Hearing impairment

Age

From **25 years** old to **31 years** old

Gender

Female

Phase

N/A

Groups that have been masked

No information

Sample size

Target sample size: **20**

Actual sample size reached: **20**

Randomization (investigator's opinion)

Undecided - It is not yet known if there will be a plan to make this available

Title and more details about the data/document

All participants' data, after anonymization, will be shared through local and international biosignal online databases. The study protocol, statistical analysis map and informed consent can also be shared.

When the data will become available and for how long

Data and documents will be available once the results are published for an unlimited period.

To whom data/document is available

University researchers

Under which criteria data/document could be used

Commitment to mention the source of data and the name of principal investigator for any use, commitment not to use for clinical purposes

From where data/document is obtainable

Correspondence with the representative of principal investigator, Zeynab Khodakarami, with email address: z.khodakarami@gmail.com

What processes are involved for a request to access data/document

Request review by the representative of principal investigator (2 weeks), sharing the application with the principal investigator (2 weeks), final statement by the representative of principal investigator
