The effect of nano-curcumin on prevention of atrial fibrillation after coronary artery bypass graft surgery: a double-blind, randomized, placebo-controlled trial

Protocol summary

Study aim
Prevention of atrial fibrillation after coronary artery bypass graft surgery and its adverse effect by curcumin

Design
Clinical trial with control group, with parallel groups, double-blind, randomized, phase 3 on 200 patients, simple randomization are used for randomization.

Settings and conduct
The study is being conducted in Shiraz and in Ordibehesht and Markazi hospitals. The intervention group included patients who candidate for open heart surgery and took 80 mg of curcumin-containing soft-gel nanomicell capsules three times a day for three days before surgery and four days after surgery with a standard medication regimen (including beta-blockers, statins, and aspirin, which patients had taken before surgery). they receive. The control group included patients who candidate for open heart surgery and receiving a placebo capsule three days before surgery and four days after surgery with a standard medication regimen. All patients are fully monitored for 120 hours after surgery

Participants/Inclusion and exclusion criteria
inclusion criteria: Patients are candidates for open heart surgery Have no history of heart surgery before surgery. Get medications from ACE / ARB, beta-blockers, statins and aspirin exclusion criteria: Cardiac arrhythmias or taking antiarrhythmic drugs use Digoxin Heart valve disorders Heart failure and EF ≤ 30% Renal failure (creatinine ≥ 1.5) Severe hepatic insufficiency (increased liver enzymes more than 3 times normal) Sensitivity to turmeric

Intervention groups
give curcumin to intervention group and palcebo to control group

Main outcome variables
Condition of atrial fibrillation arrhythmia

Scientific title
The effect of nano-curcumin on prevention of atrial fibrillation after coronary artery bypass graft surgery: a double-blind, randomized, placebo-controlled trial

Public title
effect of curcumin on prevention of atrial fibrillation after coronary artery bypass graft surgery

Purpose
Prevention

Inclusion/Exclusion criteria

Inclusion criteria:
Patients who are candidates for open heart surgery No history of cardiac surgery patients use ACE/ ARB, beta blocker, statin, ASA

Exclusion criteria:
history of Cardiac arrhythmias or taking antiarrhythmic drugs use digoxin Heart valve disorders Heart failure and EF ≤ 30% Renal failure (creatinine ≥ 1.5) Severe hepatic insufficiency (increased liver enzymes more than 3 times normal) Sensitivity to turmeric

Age
From **18 years** old to **82 years** old

Gender
Both

Phase
3

Groups that have been masked

- Participant
- Care provider
- Data analyser

Sample size
Target sample size: **200**

Randomization (investigator's opinion)
Randomized

Randomization description
Participants in the study are completely randomly divided into two groups of intervention and control. The method of randomization is simple, ie each participant is completely randomly assigned to one of two groups. In this way, patients receive numbers in the order that they attend the heart surgeon's office, and the odd numbers are in the control group and the even numbers are in the intervention group. Regarding the concealment of the study, it should be said that none of the participants knew about their assignment to the intervention and control groups.

Blinding (investigator's opinion)
Double blinded

Blinding description
Three groups of people are kept blind in this study. The first group are patients who participated in the study. These people have no information about their assignment to control or intervention groups, or the type of treatment (the main drug or placebo) . The second group of patient carers in this study also do not know about the allocation of patients to the intervention and control group and the type of treatment (the main drug or placebo).The third group analyzes the data, but they do not know the nature of the data, the type of groups and the type of treatment.

Health conditions studied

1

Description of health condition studied
cardiac disease

ICD-10 code
I25.1

ICD-10 code description
Atherosclerotic heart disease of native coronary artery

Primary outcomes

1

Description
Condition of Atrial fibrillation arrhythmia

Timepoint
five days after open heart surgery

Method of measurement
24-hour monitoring of the patient by ECG

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: took 80 mg of curcumin-containing soft-gel nanomicell capsules three times a day for three days before surgery and five days after surgery with a standard medication regimen (including beta-blockers, statins, and aspirin, which patients had taken before surgery). they receive.

Category

Prevention

2

Description

Control group: Patients who receive placebo capsules three days before surgery and five days after surgery with a standard medication regimen.The placebo capsule is exactly like the original medicine and soft gel, which contains olive oil and is made by the main drug manufacturer (Nano Elixir Sina).
