Comparison of the effect of two methods using elastic band and flamingo exercise on functional balance, proprioceptive and osteoarthritis indicators in patients with knee osteoarthritis

Protocol summary

Study aim

Determining the effect of two methods using elastic band and flamingo exercise on functional balance, proprioceptive and osteoarthritis indicators in patients with knee osteoarthritis

Design

In this single blind study, 90 people will be randomly divided into three groups: elastic band exercises group, flamingo exercises group and control group.

Settings and conduct

90 patients referred to Bu Ali Medical Clinic in Birjand were selected and randomly assigned to three groups: the first group of elastic band exercises program Based on the guidelines of the American School of Sports Medicine, and the second group of They will use the Flamingo movement exercises program for 8 weeks and the third group will continue their daily life. single blind: Participants will be unaware of the intervention groups and the type of interventions in other groups.

Participants/Inclusion and exclusion criteria

Inclusion criteria: 45 years and older, Diagnosis and confirmation of knee osteoarthritis by a specialist in rheumatology, Kellgren/Lawrence scale knee osteoarthritis grade 2/3, Ability to understand and accept written and informed consent, Ability to walk with or without aids, Do not use a wheelchair to move, No history of surgery and arthroplasty of the knee joint, No Parkinson's disease, epilepsy, dizziness and a history of knee fractures, No underlying diseases such as diabetes, hypothyroidism and neuropathy, Absence of dementia and Alzheimer's, BMI less than 30; Exclusion criteria: Inability to perform movements due to severe pain or orthopedic limitations, Participate in regular exercise or other specific activity

Intervention groups

There are 3 groups, 1- Uses elastic bands to perform exercises, 2- Performs flamingo exercises and 3- the

control group does not perform any of the above interventions.

Main outcome variables

Changes in functional balance score, proprioceptive and osteoarthritis indices

Scientific title
 Comparison of the effect of two methods using elastic band and flamingo exercise on functional balance, proprioceptive and osteoarthritis indicators in patients with knee osteoarthritis

Public title
 Comparison of the effect of using elastic band and flamingo exercise on knee osteoarthritis

Purpose
 Supportive

Inclusion/Exclusion criteria
Inclusion criteria:
 45 years and older Diagnosis and confirmation of knee osteoarthritis by a specialist in rheumatology Kellgren/Lawrence scale knee osteoarthritis grade 2 and 3 Ability to understand and accept written and informed consent Ability to walk with or without aids Do not use a wheelchair to move No history of surgery and arthroplasty of the knee joint No Parkinson's disease, epilepsy, dizziness and a history of knee fractures No underlying diseases such as diabetes, hypothyroidism and neuropathy Absence of dementia and Alzheimer's BMI less than 30
Exclusion criteria:
 Inability to perform movements due to severe pain or orthopedic limitations Participate in regular exercise or other specific activity

Age
 From **45 years** old

Gender
 Both

Phase
 N/A

Groups that have been masked

Sample size
 Target sample size: **90**
 Actual sample size reached: **82**

Randomization (investigator's opinion)
 Randomized

Randomization description
 Randomization of individuals in the form of restricted randomization will be of the type of random allocation rule. In this way, cards are prepared according to the number of participants and the names of the intervention methods are written on them and placed in a box. Individuals are asked to randomly remove a card from the box (selected cards will not be returned to the box after selection). In this way, the type of intervention will be determined for each person and random allocation will be performed.

Blinding (investigator's opinion)

Single blinded
Blinding description
 This study will be of the single blind type. In this way, participants will be unaware of the intervention groups and the type of interventions in other groups and will only perform the intervention intended for them by entering one of the groups.

Osteoarthritis of knee

Primary outcomes

1

Description

Functional balance

Timepoint

Before the intervention and after the end of the intervention

Method of measurement

Berg balance scale, Timed up and go test

2

Description

Proprioceptive

Timepoint

Before the intervention and after the end of the intervention

Method of measurement

Active movement extent discrimination apparatus

3

Description

Pain

Timepoint

Before the intervention and after the end of the intervention

Method of measurement

Western Ontario and McMaster universities osteoarthritis index, Visual analogue scale

4

Description

Joint stiffness

Timepoint

Before the intervention and after the end of the intervention

Method of measurement

Western Ontario and McMaster universities osteoarthritis index

5

Description

Physical performance

Timepoint

Before the intervention and after the end of the intervention

Intervention groups

1

Description

Intervention group: Intervention group 1: Elastic band exercise group that continues these exercises for 8 weeks. The training program for the elastic band will be based on the guidelines provided by the American School of Sports Medicine. This program will include 5-10 minutes of warm-up before training, 5-10 minutes of cooling down after training and 5 sets with 10 repetitions, three days a week for up to 8 weeks and at certain hours (evening). In the first four weeks, a low-strength elastic band (yellow) is used. To increase the resistance of the exercises in the following weeks, by

adding one more repetition to the previous movements, up to 15 repetitions and replacement with a new band (red color) will continue. Exercises in this group will include knee flexion / extension, ankle dorsiflexion / plantarflexion, hip adduction / abduction, hip flexion / extension, and internal /external rotation hip.

Category

Rehabilitation

2

Description

Intervention group: The second intervention group is the flamingo exercise group. The training program of this group includes standing on one leg, three times a day, each time for one minute and eight weeks and at certain hours (evening). While doing this exercise, the eyes are open and the hand raised to the upper leg may be leaning somewhere and the other hand may be freely in line with the body.

Category

Rehabilitation

3

Description

Control group: Group 3: They do not receive any of the above exercises and lead a normal life.
