Efficacy of Daclatasvir+Sofosbuvir in patients with severe acute respiratory syndrome coronavirus (SARS-COVID-19)

Protocol summary

Study aim

Determination of the efficacy of daclatasvir + sofosbuvir in patients with COVID-19

Design

Using a table of random numbers, they are divided into intervention and control groups. The volume of each group is 35 patients. The present study is a double-blind study.

Settings and conduct

Patients admitted to Razi Hospital in Ahvaz will be divided into two groups based on a table of random numbers. Radiologists, treatment outcome evaluators, and statisticians will be unaware of assignments to groups, but patients and physicians will be aware of treatment groups.

Participants/Inclusion and exclusion criteria

Admission of hospitalized patients over 18 years of age; withdrawal of allergic reaction; pregnancy or lactation; any previous intervention; use of Amiodarone; need for mechanical ventilation and EGFR less than 50.

Intervention groups

In the intervention group, patients did not receive one Daclatasvir / Sofosbuvir tablet daily for 7 days in addition to the national recommendations, and the control group did not receive the drug.

Main outcome variables

The primary outcome is clinical improvement within 14 days of starting treatment, for which fever, respiration rate per minute, and oxygen saturation are determined daily. Criteria for clinical improvement include fever normalization (37.2 ° C), respiration rate (≤ 24 per minute), and oxygen saturation (94% in room air) and are stable for up to 24 hours.

Scientific title

Efficacy of Daclatasvir+Sofosbuvir in patients with severe acute respiratory syndrome coronavirus (SARS-COVID-19)

Public title

Efficacy of Daclatasvir+Sofosbuvir in patients with severe acute respiratory syndrome coronavirus (SARS-COVID-19)

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Age over 18 years old Respiratory rate more than 30 per minute Oxygen saturation less than 93% Confirmation of pneumonia by diagnostic CT scan of the chest

Exclusion criteria:

Taking the drug Amiodarone Kidney failure

Age

From **18 years** old

Gender

Both

Phase

1-2

Groups that have been masked

- Participant
- Care provider

Sample size

Target sample size: **70**

Randomization (investigator's opinion)

Randomized

Randomization description

According to the patients' block classification table, eleven blocks of six are divided into two groups a and b and the intervention is considered by the researcher of group a and the control group b. According to the date of hospitalization, patients were divided into groups a and b, respectively, according to blockade. The concealment of the study is double-blind.

Blinding (investigator's opinion)

Double blinded

Blinding description

After providing explanations to patients by the researcher using a random drug process, the drug is prescribed in such a way that the researcher and the patient do not know about the drug and only the treating physician knows about the drug.

Secondary outcomes

1

Description

Secondary consequences include the need for mechanical ventilation, chest changes (day 14 or earlier as determined by the physician), serious accidents, and mortality.

Timepoint

14th day

Method of measurement

Physical examination

Intervention groups

1

Description

Patients in the intervention group receive one Daclatasvir / Sofosbuvir 60/400 mg tablet (Danesh Pharmaceutical Development Company) daily for 7 days.

Category

Treatment - Drugs

2

Description

Control group: Received national protocol drugs.
