Endometrial preparation with or without gonadotropin-releasing hormone agonist for frozen-thawed embryo transfer in patients with polycystic ovarian syndrome

Protocol summary

Study aim

Comparison of live births rate in two method of endometrial preparation for embryo transfer in patients with polycystic ovarian syndrome.

Design

A randomized clinical trial with control group, open label, two arm parallel group design of 212 patients. Randomization is performed using a computer-generated random assignment schedule for each patient. Sealed and numbered envelopes are used to conceal the treatment allocation until randomization.

Settings and conduct

Female infertility Clinic of ROYAN institute.

Participants/Inclusion and exclusion criteria

Inclusion Criteria: Infertile women with PCOS based on Rotterdam criteria; age 20-37 years. Conditions for not entering the study: Women with hematologic and autoimmune disorders; couples with chromosomal and genetic abnormalities; women with uterine anomalies; women with uterine surgical history; women with endometriosis and adenomyosis; women with hydrosalpinx; women with uterine fibroids; early (day 3) follicular phase follicle stimulating hormone levels ≥ 12 IU/L; severe male factor infertility (azoospermia); surrogate mothers and embryo donation.

Intervention groups

Intervention group: The group of endometrial preparation with gonadotropin-releasing hormone agonist. In the this group, the endometrium of patients for embryo transfer will be prepared through the standard protocol using a gonadotropin-releasing hormone agonist. Control group: The group of endometrial preparation without gonadotropin-releasing hormone agonist. In the this group, the endometrium of patients for embryo transfer will be prepared through the standard protocol using steroid hormone administration without gonadotropin-releasing hormone agonist.

Main outcome variables

Live births rate

Randomization (investigator's opinion)

Randomized

Randomization description

Block randomization method is designed by epidemiologist using STATA software version 13 and the number of blocks considered is 6. The random allocation list for patients is solely available to the epidemiologist. In order to hide the random allocation process, a total of 212 envelopes are prepared, and only the methodologist has been aware of table of random numbers. When the doctor declared the patient's eligibility, the methodologist provided the doctor with the envelope. The group will be selected and based on the type of group mentioned in the envelope.

Female infertility, unspecified

Primary outcomes

1

Description

Live birth rate; live birth is defined in which a live fetus is delivered beyond 20 completed weeks of gestational.

Timepoint

Only once; at least 20 weeks after embryo transfer.

Method of measurement

Clinical information.

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: The group of endometrial preparation with gonadotropin-releasing hormone agonist. In this group, the endometrium of patients for embryo transfer

will be prepared through the standard protocol using a gonadotropin-releasing hormone agonist. This group has pituitary suppression prior to steroid hormone administration. Pituitary suppression in patients will be performed using 500 micro-gram suprefact (Buserelin, Sanofi Aventis, Germany) injection per day subcutaneously from day 17 of the menstrual and continued it for 14 days. Then, the dose of suprefact was reduced to 200 micro-gram per day, and the endometrium will be prepared through daily administration of 6 mg of estradiol valerate tablets (Abouryhan Pharmacy Company, Tehran, Iran) for 12 days. When endometrial thickness reached 8 mm or more, 50 mg intramuscular progesterone (Abouryhan Pharmacy Company, Tehran, Iran) daily will be commenced, and suprefact will be stopped. Embryo transfer will be performed at 48 ± 3 hours after progesterone injection for two day embryos and 72 ± 3 hours after progesterone injection for three day embryos.

2

Description

Control group: The group of endometrial preparation without gonadotropin-releasing hormone agonist. In this group, the endometrium of patients for embryo transfer will be prepared through the standard protocol using steroid hormone administration without gonadotropin-releasing hormone agonist. This group begins steroid supplementation without prior pituitary desensitization. The endometrium will be prepared through daily administration of 6 mg of estradiol valerate tablets (Abouryhan Pharmacy Company, Tehran, Iran) for 12 days. When endometrial thickness reached 8 mm or more, 50 mg intramuscular progesterone (Abouryhan Pharmacy Company, Tehran, Iran) daily will be commenced. Embryo transfer will be performed at 48 ± 3 hours after progesterone injection for two day embryos and 72 ± 3 hours after progesterone injection for three day embryos.
