Comparison the Effect of Fumaria Parviflora and Gabapentin in Treatment of Uremic Pruritus in Hemodialysis Patients

Protocol summary

Study aim

This study was designed to evaluate the effect of Fumaria Parviflora capsule and compare it with Gabapentin capsule on the improvement of uremic pruritus in dialysis

Design

In this study, 52 dialysis patients with pruritus were divided into two groups: Fumaria Parviflora capsules and gabapentin (26 patients in each group). The clinical trial phase of this study is 3. How to divide randomly is simple. This study is a two-way blind study. In this study, before the intervention and after 8 weeks of capsule use, the amount of pruritus was measured using the VAS questionnaire.

Settings and conduct

The study site is Arak University of Medical Sciences. First, the pruritus rate of dialysis patients is measured. If they have the conditions to study, they are randomly divided into two groups. One group receives the Fumaria Parviflora capsule and the other group receives the gabapentin capsule. This study is a double-blind study that participants and statistical analysts do not know the groups. At the end of the 8-week intervention phase, the amount of pruritus in these participants are measured again and the effectiveness of the Fumaria Parviflora capsule is compared with that of gabapentin capsule.

Participants/Inclusion and exclusion criteria

Dialysis patients with pruritus are included in the study. These patients should not have heart disease. If a participant becomes allergic to the Fumaria Parviflora capsule during the study or is unable to continue the study, he / she will be excluded from the study.

Intervention groups

Fumaria Parviflora Capsule Group: This group takes one Fumaria Parviflora capsule daily for 8 weeks. Gabapentin capsule group: This group takes gabapentin capsules three times a week for up to 8 weeks.

Main outcome variables

pruritis

Scientific title

Comparison the Effect of Fumaria Parviflora and Gabapentin in Treatment of Uremic Pruritus in Hemodialysis Patients

Public title

The effect of Fumaria Parviflora and Gabapentin on pruritus in hemodialysis patients

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Be on dialysis for at least six months Having pruritus for at least six weeks

Exclusion criteria:

Allergy to herbal medicines Lack of uremic pruritus

Age

From **18 years** old to **55 years** old

Gender

Both

Phase

3

Groups that have been masked

- Participant
- Data analyser

Sample size

Target sample size: **52**

Randomization (investigator's opinion)

Randomized

Randomization description

The present study is a simple randomized clinical trial on dialysis patients with pruritus. In this study, people are divided into two groups of drugs and placebo. The method of assigning subjects to each group is that individuals are assigned every other one to one group.

Blinding (investigator's opinion)

Double blinded

Blinding description

The two groups of drug and placebo receive very similar capsules, and they do not know the contents of the capsule. The statistical analyzer is not informed about the groups.

Intervention groups

1

Description

"Intervention group:" This group is given Fumaria officinalis capsules. Fumaria officinalis plant belongs to the anemone plant family. Total extract of this plant is used. The dose is 1500 mg / kg. Take one capsule after dinner for 8 weeks. This capsule is made by Shahid Beheshti University Pharmacy Department.

Category

Treatment - Drugs

2

Description

"Intervention group": This group is given gabapentin capsules. The dose is 300 mg / kg. For 8 weeks, take three capsules every week after dinner. This capsule is made by Raha Pharmaceutical Company of Isfahan.
