

Clinical Trial Protocol

Iranian Registry of Clinical Trials

10 Jun 2026

Effects of muscle energy technique in patients with tension type headache on pain , range of motion and functional level

Protocol summary

Study aim

study aim was how tension type headache was improved by METS and myofascial release

Design

A single blinded randomized control trial with sample size of 48 patients

Settings and conduct

setting of study was in Rehabilitation and Injury Management Department of Medcare International Hospital Gujranwala

Participants/Inclusion and exclusion criteria

Patients of both gender of age 18-40 years with diagnosis of tension type headache and chronic tension type headache were included. Other inclusion criteria regarding tension type headache were at least 10 episodes occurring on ≥ 1 day per month for at least 3 months. Headache episodes lasting from 30 minutes to 7 days

Intervention groups

Muscle energy technique along with myofascial release technique on upper trapezius and sternocleidomastoid was applied on patients of experimental group . Only myofascial release technique was used on upper trapezius and sternocleidomastoid muscle to control group

Main outcome variables

Outcome variables of pain, range of motion and functional level of patients

Scientific title

Effects of muscle energy technique in patients with tension type headache on pain , range of motion and functional level

Public title

Effects of muscle energy technique in patients with tension type headache on pain , range of motion and functional level

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:
Patients of both gender of age 18-40 years with diagnosis of ETTH and CTTH were included At least 10 episodes occurring on ≥ 1 day per month for at least 3 months Headache episodes lasting from 30 minutes to 7 days

Exclusion criteria:
Patients with Headache that is aggravated by head movements, musculoskeletal and metabolic disorders with symptoms homogenous to headache (rheumatoid arthritis), previous neck trauma, Vertigo, dizziness, arterial hypertension, Malignancy, infection, trauma, bone deformities were excluded from the study.

Age
From **18 years** old to **48 years** old

Gender
Both

Phase
N/A

Groups that have been masked
No information

Sample size
Target sample size: **48**
Actual sample size reached: **48**

Randomization (investigator's opinion)
Randomized

Randomization description
Participants were selected through Non probability convenient sampling technique as per inclusion and exclusion criteria. Patients of TTH were randomly allocated into 2 equal groups (Group A=24 and Group B=24) and randomization was done by lottery method.

Blinding (investigator's opinion)
Not blinded

Blinding description

Placebo
Not used

Assignment
Parallel

Other design features
A prospective randomized clinical trial study

Health conditions studied

1

Description of health condition studied

Tension type headache

ICD-10 code

ICD-10 code description

Primary outcomes

1

Description

pain

Timepoint

baseline, 4th and 8th weeks since intervention

Method of measurement

Numerical pain Rating scale (NPRS)

2

Description

range of motion

Timepoint

baseline, 4th and 8th weeks since intervention

Method of measurement

Inclinometer is used to assess cervical range of motion.

3

Description

functional level

Timepoint

baseline, 4th and 8th weeks since intervention

Method of measurement

Headache disability index and headache impact test

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group; Muscle Energy Technique on upper trapezius The patient places in a moderate opposed exertion (20% of the accessible solidarity) to convey the decent shoulder to the ear (a shrug movement) and the ear to the shoulder. There ought to be a moderate level of duty and no uneasiness ought to be experienced. The compression goes on for 7-10 seconds and when the exertion is totally loose. Muscle energy technique on sternocleidomastoid Patient is approached to lift a little degree to the roof the completely turned head and to hold the breath. There is no requirement for the

professional to apply opposition when the head is raised as this is adequately given by gravity. Between 7-10 seconds of isometric constriction, the patient is advised to discharge the exertion (and breath) bit by bit and position the head on the table so that there is a little level of expansion. Moist heating pad is applied for 10 minutes before each session. Protocol 2: Myofascial release technique on upper trapezius The muscle is put on a gentle leeway by moving the ear somewhat to the shoulder on a similar side with the patient recumbent, or presumably sitting. The whole mass of the upper trapezius is raised off the supraspinatus muscle and summit in a pincer grasp. The muscle at that point rolls firmly between the fingers and thumb to palpate for a knob and tight groups to discover Trigger point's spot delicacy. Treatment session lasts for 10 minutes of myofascial release on each side. Myofascial release technique on sternocleidomastoid The patient sits in a low-upheld firm-sitting easy chair easily and loose with each hand's fingers snared under the seat or under the thigh. The patient's head might be supported in the administrator's hand to enable the patient to loosen up the neck muscles, with the administrator's head leaning against the administrator's arm or chest. The patient is encouraged to rest the administrator's head weight and utilize greatest profound stomach breathing, which likewise unwinds. Therapist applies pressure on trigger points located in sternal and clavicular divisions of muscle with pincer grip. Gradually increasing the pressure and releasing the trigger points one by one. This is followed by stretching of muscle by deep inhalation, rotation of head on opposite side and rotation of chin on same side. Treatment session lasts for 10 minutes of myofascial release on each side.

Treatment - Other

2

Description

Control group: Treatment applied in this group is myofascial release technique for upper trapezius and sternocleidomastoid muscle. This was applied in the same way mentioned in the protocol 2 of intervention no. 1.
