

Clinical Trial Protocol

Iranian Registry of Clinical Trials

09 Jun 2026

Comparison of the effect of vitamin C and N-acetyl cysteine (NAC) on improving clinical symptoms and reducing the duration of hospitalization in patients with covid-19

Protocol summary

Study aim

Comparison of the effect of vitamin C and N-acetyl cysteine (NAC) on improving clinical symptoms and reducing the duration of hospitalization in patients with covid-19

Design

The study will be double blind and clinical trial. 232 patients will be randomly divided into 2 groups. The groups will be parallel. The trial phase will be 3

Settings and conduct

Patients with covid-19 in Arak are divided into 2 groups by simple randomization with envelopes. The study is double-blind in which outcome evaluator and data analyst and participant are kept blind.

Participants/Inclusion and exclusion criteria

Inclusion criteria: age over 18 years, no pregnancy or lactation, no deficiency of G6PD enzyme, no history of calcium oxalate kidney stones, no sensitivity to drugs
Exclusion criteria: dissatisfaction

Intervention groups

Intervention group 1: Vitamin C tablets with a dose of 1 gram are given every 8 hours for 5 days. Intervention group 2: N-acetylcysteine tablets at a dose of 600 mg every 8 hours for 5 days.

Main outcome variables

Duration of hospitalization in the intensive care unit, percentage of oxygen saturation

Scientific title

Comparison of the effect of vitamin C and N-acetyl cysteine (NAC) on improving clinical symptoms and reducing the duration of hospitalization in patients with covid-19

Public title

Comparison of the effect of vitamin C and N-acetyl

cysteine (NAC) on improving clinical symptoms and reducing the duration of hospitalization in patients with covid-19

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Age over 18 years No pregnancy or breastfeeding
Absence of G6PD deficiency No history of calcium oxalate kidney stones Lack of sensitivity to drugs

Exclusion criteria:

Dissatisfaction

Age

From **18 years** old

Gender

Both

Phase

3

Groups that have been masked

- Participant
- Outcome assessor
- Data analyser

Sample size

Target sample size: **232**

Randomization (investigator's opinion)

Randomized

Randomization description

Simple individual randomization with random allocation with envelopes in 2 groups A and B . In this method, we selected a number of cards or letters as an intervention group and the same number of cards for the control group, then the cards were merged. One card was taken out and its allocation was registered and the card was returned to the other cards after leaving. Then the cards are merged again and we remove another card. This process continues to reach a random sequence according to sample size.

Blinding (investigator's opinion)

Double blinded

Blinding description

This study is a double-blind clinical trial. In this study, patients consciously consented to take vitamin C and N-acetylcysteine supplements but did not know the type of group they were entering. The drug is prescribed by infectious and internal medicine physicians in charge of the project and is randomly given to one of these two groups; However, the intern in charge of the project, who is responsible for registering questionnaires and collecting data, also does not know about the patient group.
