Comparing of the analgesic effect of pericapsular ultrasound-guided nerve group block and fascia iliaca block in patients with hip fracture for neuraxial block; a pilot study

Protocol summary

Study aim
Comparing of the analgesic effect of pericapsular ultrasound-guided nerve group block and fascia iliaca block in patients with hip fracture for neuraxial block as a pilot study

Design
Clinical trial with control group, with parallel groups, double-blind, randomized, phase 3 on 50 patients

Settings and conduct
This double-blind clinical trial study will be performed on 50 patients between the ages of 18-80 years in two groups (pericapsular nerve block and fascia iliac with ultrasound block) in Imam Khomeini hospital in Urmia. Pain will be checked before, 10 minutes after block and before positioning for neuraxial anesthesia using visual analog scale.

Participants/Inclusion and exclusion criteria
Inclusion criteria: Patients with hip fracture, American Society of Anesthesiologists (ASA) I and II, Lack of deformity in spinal, Age between 18 to 80 years; Exclusion criteria: Having heart disease, Sensitivity to local anesthetics, Coagulopathy disorders

Intervention groups
Intervention group 1: Pericapsular ultrasound-guided nerve block Intervention group 2: Fascia iliaca block

Main outcome variables
Pain

Scientific title
Comparing of the analgesic effect of pericapsular ultrasound-guided nerve group block and fascia iliaca block in patients with hip fracture for neuraxial block; a pilot study

Public title
Analgesic effect of pericapsular nerve and fascia iliaca block in hip fracture

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Lack of deformity in spinal American Society of Anesthesiologists (ASA) I and II Age between 18 to 80 years

Exclusion criteria:

Having heart disease Sensitivity to local anesthetics Coagulopathy disorders

Age

From **18 years** old to **80 years** old

Gender

Both

Phase

3

Groups that have been masked

- Participant
- Data analyser

Sample size

Target sample size: **40**

Randomization (investigator's opinion)

Randomized

Randomization description

40 patients, using random allocation software, were randomly divided into pericapsular nerve block and fascia iliaca block groups. By selecting the simple randomization method in the randomization box and entering the determined total sample size in this software, numbers were given to the patients and the patients were allocated into two groups according to computer-generated numbers. The tool used is random allocation software version 2.0 in which by selecting the number of groups and the sample size, a random sequence sheet is provided for the control and intervention group.

Blinding (investigator's opinion)

Double blinded

Blinding description

Patients and statistical analyzers were unaware of the patient was anesthetized using pericapsular nerve block and fascia iliaca block. Anesthesia was performed by an anesthesiologist in the operating room for randomly selected patients. In this way, the patient was only aware that the block was performed on him/her, but was unaware of its type, and also the statistical analyzer will receive the data in code A and B for the two intervention groups.

Primary outcomes

1

Description

Pain

Timepoint

Pain will be checked before, 10 minutes after block and before positioning for neuraxial anesthesia using visual analog scale

Method of measurement

Visual analog scale

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group 1: In the precapsular block, 20 ml of bupivacaine 0.25% (produced by Tebshahr company) using an ultrasound guide for analgesia is injected deep into the plate between the muscle and the fascia, in front of which is the pseudos tendon and behind which is the pubic bone ramus, and the patient is in a supine position.

Category

Treatment - Drugs

2

Description
Intervention group 2: In the fascia iliac block, 20 ml of 0.25% (produced by Tebshahr company) bupivacaine using an ultrasound guide for analgesia is injected deep into the fascia iliac and in the upper lateral part of the iliac muscle, and the patient is in a supine position.
