

Clinical Trial Protocol

Iranian Registry of Clinical Trials

27 Jul 2026

comparison of concentric and eccentric progressive resistive exercises on pain and disability in posterior tibial tendon dysfunction

Protocol summary

Study aim

To compare the effects in concentric and eccentric progressive resistive exercises on pain and disability in posterior tibial tendon dysfunction.

Design

A concealed, randomized, single blinded, clinical trial with a parallel group design of 30 patients. Lottery method will be used for Randomization.

Settings and conduct

Haq Orthopedic Hospital, Rabia Welfare hospital, Kanaan Physiotherapy and Spine Clinic

Participants/Inclusion and exclusion criteria

Inclusion criteria: • Age: 40–60 years • Current complaint of foot and ankle pain that has lasted for three months or more • Flexible pes planovalgus deformity in the clinical assessment • Pes planovalgus foot deformity with longitudinal arch flattening verified by radiograph
Exclusion criteria: • Rigid foot deformity • Acute infection or alcohol addiction limiting participation in study protocol
Acute use of local or systemic analgesics • Acute overuse or traumatic injury to the lower leg (excluding pes planovalgus associated pathology) • Prior surgery to the lower limb

Intervention groups

Group 1 will receive stretching exercises and foot orthosis and concentric progressive resistive exercises (CPR Group) including plantar flexion and eversion of ankle joint. Group 2 will receive stretching exercises and foot orthosis eccentric progressive exercises (OE Group) including dorsiflexion and inversion of ankle joint.

Main outcome variables

Pain and Disability: Pain will be measured through Numeric Pain Rating Scale (NPRS) and disability will be measured through Pain disability index (PDI) scale.

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Age: 40–60 years • Current complaint of foot and ankle pain that has lasted for three months or more Flexible pes planovalgus deformity in the clinical assessment Pes planovalgus foot deformity with longitudinal arch flattening verified by radiograph

Exclusion criteria:

Rigid foot deformity Acute infection or alcohol addiction limiting participation in study protocol Acute use of local or systemic analgesics Acute overuse or traumatic injury to the lower leg (excluding pes planovalgus associated pathology) Prior surgery to the lower limb

Age

From **40 years** old to **60 years** old

Gender

Both

Phase

3

Groups that have been masked

- Participant

Sample size

Target sample size: **30**

Randomization (investigator's opinion)

Randomized

Randomization description

Taking into account the above mentioned inclusion and exclusion criteria, patients will be recruited in the study through convenient sampling technique and then will be randomly assigned to each group according to consort guideline 2010. Written informed consent will be taken. After enrollment into study, patient will be allocated either to Group 1 and Group 2 by lottery method. No. of Chits will be equal to total sample size. Each patients will be requested to draw a chit from the box and after that patient will be recruited into either Group 1 and Group 2

Blinding (investigator's opinion)

Single blinded

Blinding description

1. It will be a single blinded study 2. Participants of both groups will be kept unfamiliar to the treatment protocol by lottery method. 3. Participants of both groups will be called for treatment on alternate days in a week. 4. The health care provider (physical therapist) will be aware to the whole treatment procedure that will be provided to the participants.

Health conditions studied

1

Description of health condition studied

Posterior Tibial Tendon Dysfunction

ICD-10 code

M76.82

ICD-10 code description

Posterior tibial tendinitis

Primary outcomes

1

Description

Pain

Timepoint

Intervention treatment will be given to subjects 2 sessions per week and 2 sets per day, 1 set in clinical setup and 2nd for home plan. Total intervention period will be of 6 weeks.

Method of measurement

Pain Disability Index (PDI)

2

Description

Disability

Timepoint

Intervention treatment will be given to subjects 2 sessions per week and 2 sets per day, 1 set in clinical setup and 2nd for home plan. Total intervention period will be of 6 weeks.

Method of measurement

Numeric Pain Rating Scale (NPRS)

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group 1: will perform posterior tibialis exercise with ankle in planter flexion and eversion in supine lying position + heating packs for 20 minutes and A Thera-band will be placed under the Ankle and advise the patient to extend their ankle by pushing the downward of ankle into thera-band while keep your ankle in planter flexion during exercise. The hold time for isometric contraction will be 10 sec follow by a rest period of 5 sec in between the contractions. Each patient will be complete 2 sessions in a day, in each session consist of 1 set of 10 repetitions of planter flexion perform once at the hospital and once at home for the 2 days/6-week time for testing up:
