Comparing the Effect of Betamethasone and Ketorolac Injection on Treatment of De Quervain`s Tenosynovitis in Diabetic Patients

Protocol summary

Study aim

Comparison of the effect of local injection of betamethasone and ketorolac in treatment of patients with De Quervain`s tenosynovitis and diabetes .

Design

Clinical trial with two parallel groups, double-blind, randomized, phase 4 on 60 patients. The rand function of Excel software was used for randomization.

Settings and conduct

We decided to compare the effectiveness of ketorolac as a non-steroidal anti-inflammatory drug versus betamethasone as a steroidal anti-inflammatory drug. Therefore, After visiting in the specialized orthopedic clinic and obtaining informed consent, Ketorolac or betamethasone will inject in a double-blind manner (doctor and patient) and its results in pain control will be studied and compared in two groups. Doctor's informed assistant will prepare the syringe containing the medicine and record patients' information for follow-up.

Participants/Inclusion and exclusion criteria

Patients with De Quervain`s tenosynovitis and controlled type 2 diabetes over 18 years of age can enter the study. Pregnant women, patients who have a history of local corticosteroid injection or previous surgery and fracture in the same wrist will not be included in the study.

Intervention groups

In this study, patients are randomly divided into two groups treated with betamethasone injection and ketorolac injection.

Main outcome variables

Investigating the effectiveness of ketorolac injection and comparing it with betamethasone in controlling the pain of De Quervain's tenosynovitis in diabetic patients.

Scientific title

Comparing the Effect of Betamethasone and Ketorolac Injection on Treatment of De Quervain`s Tenosynovitis in Diabetic Patients

Public title

Comparing the Effect of Betamethasone and Ketorolac Injection on Treatment of De Quervain`s Tenosynovitis

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

De Quervains Tenosynovitis Patients Diabetes mellitus Type 2 Patients Persons more than 18 yo ages

Exclusion criteria:

History of Allergic Reaction to Lidocaine ,Ketorolac (and other NSAIDs) ,Aspirin and Betamethasone History of Corticosteroids Injection in past 3 months History of surgery due to De Quervain`s Tenosynovitis in same wrist Pregnant ,Breastfeeding period and Patient with Gestational Diabetes Skin complications such as wounds, eczema or rash at the injection site Active infection at the injection site History of acute wrist trauma, history of wrist fracture, rheumatoid arthritis, uncontrolled diabetes Patients with type 1 diabetes

Age

From **18 years** old

Gender

Both

Phase

3

Groups that have been masked

- Participant
- Care provider
- Outcome assessor

Sample size

Target sample size: **60**

Randomization (investigator's opinion)

Randomized

Randomization description

The sample size of 60 patients was divided into 10 blocks with different random sizes of 4, 6 and 8 (3 blocks of 4, 4 blocks of 6, 3 blocks of 8) using the Permuted block randomization method by Excel computer software. Then the people of each block are randomly and equally divided into two groups under treatment A or B, and finally 30 patients will be treated with A and 30 patients will be treated with B.

Blinding (investigator's opinion)

Double blinded

Blinding description

Considering the proven effectiveness of both betamethasone and ketorolac in the treatment of De Quervains patients, in a randomized and double-blind manner, neither the treating doctor nor the patient knows about the drug in the syringe, and the preparation and recording of information is the responsibility of the physician's assistant who It is aware.
