Assessment of effect of active cycle of breathing techniques (ACBT) on airway clearance in covid-19 patients

Protocol summary

Study aim

The aim of this study is to evaluate the effect of ACBT exercises on airway clearance in COVID-19 patients and to fill the research gap for both studies that will help patients in future to deal with post COVID complications more conveniently with cost effective procedures.

Design

100 covid-19 patients from both ICU and indoor were taken. ACBT treatment was applied. No placebo effect was used. Non randomized, no biasness and not blinded.

Settings and conduct

study was conducted in ICU and indoor wards of different hospitals with proper use of PPE-protective personal equipment's.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Patients having the age range from 30-60 were selected. Patients who were admitted to ICU or COVID indoor patients were included. Patients who were conscious were selected for this study. Exclusion criteria: Individuals below age 30, without COVID or with other comorbidities were prohibited from our review. Patients with decreased awareness and conscious level were not included in the assortment criteria. Patients admitted to CCU were excluded

Intervention groups

A total of 100 patients were recruited including both males and females. They were taken for the application of active cycles of breathing techniques in different Indoors and ICU units from multiple hospitals in Lahore city. Prior to exercise subjects were evaluated with the help of a standardized questionnaire i.e. Interventions Evaluation on COVID-19 patients-Questionnaire. After getting the active cycles of breathing techniques patients were again evaluated with the Interventions Evaluation on COVID-19 patients-Questionnaire. All registered subjects were informed of the study protocol.

Main outcome variables

Oxygen saturation, Breathing rate, Forced expiratory volume, Body temperature, heart rate and blood

pressure were important variables because they fluctuate differently in both gender

Health conditions studied

1

Description of health condition studied

In this research Coronavirus (COVID-19) pandemic was studied. Patients with Obstructive pulmonary disease that is corona was studied to observe the ACBT treatment plan. Previous studies have shown that incidence of COVID-19 has increased more effectively among both gender ranges from 43% male and 57% female. Approximately, major population suffered with COVID-19 report fever, shortness of breath, cough, tachypnea, chest tightness, dyspnea, chills, high-grade temperature and even death.

ICD-10 code

U07

ICD-10 code description

COVID-19, virus identified

Primary outcomes

1

Description

Pre outcomes were breathing rate 48 breath pre minute. After interventions application results were improved breathing rate was 16-20 breath pre minute which was like normal people.

Timepoint

In this study patients were checked before and after the ACBT interventions applied. symptoms of berating compilation were assessed. cough, dyspnea, shortness of breath. The treatment application time was 2 weeks. Patient history was taken prior to treatment and after 2 weeks treatment plan.

Method of measurement

The patient examination was performed before and after the treatment by using the tool Interventions Evaluation on COVID-19 patients-Questionnaire to assess the impact of Coronavirus on people and exercises effects on airways clearance.

2

Description

Temperature was raised up to (103F) which represents body immune system activation against virus or other foreign agent. after treatment application temperature reduced to optimal level that is 37F.

Timepoint

In this study patients were checked before and after the ACBT interventions applied. Fever/pyrexia was the initial sign along with oxygen level during corona patient diagnosis. The treatment application time was 2 weeks. Patient history was taken prior to treatment and after 2 weeks treatment plan.

Method of measurement

The patient examination was performed before and after the treatment by using the tool Interventions Evaluation on COVID-19 patients-Questionnaire to assess the impact of Coronavirus on people and exercises effects on airways clearance.

3

Description

O2 saturation was less than 75% -80% before treatment applied an after treatment application O2 improve to >90%. ACBT proved more beneficial for COVID-19 patients.

Timepoint

In this study patients were checked before and after the ACBT interventions applied. O2 saturation vital sign was checked in corona patients every 24-hours because most deadly agent was oxygen vital. The treatment application time was 2 weeks. Patient history was taken prior to treatment and after 2 weeks treatment plan.

Method of measurement

The patient examination was performed before and after the treatment by using the tool Interventions Evaluation on COVID-19 patients-Questionnaire to assess the impact of Coronavirus on people and exercises effects on airways clearance.

Secondary outcomes

empty

Intervention groups

1

Description

Control group: COVID-19 population was targeted. Total 100 patients were taken. In this study pre and post vitals and required information history was taken. 2 groups was involved. One group is labelled as pre- group with no intervention applied and severe COVID-19 symptoms. The prior vitals then compared with post vitals after 2 weeks of treatment application to check outcome results. Procedure repeated 2- times a week. Treatment method was Active cycle of breathing techniques, use to reduced the pulmonary symptoms.

Category

Treatment - Other

2

Description

Intervention group: COVID-19 population was targeted. Total 100 patients were taken. 2nd group was labelled as Post- group and vitals and required information history

was taken after 2 weeks of treatment application to check outcome results. Procedure repeated 2- times a week. Treatment method was Active cycle of breathing techniques, use to reduced the pulmonary symptoms. results compared to the prior vitals were 96% more satisfactory and ACBT proved beneficial for airway clearance in COVID-19 patients.
