Effectiveness of virtual rehabilitation versus therapeutic exercises in the balance training of lower limb among post-stroke patients

Protocol summary

Study aim

To check the effects of virtual rehabilitation versus therapeutic exercises in improving the balance of the lower limb of post-stroke patients.

Design

Randomized Control Trial

Settings and conduct

Physiotherapy Department of Abdullah Hospital
Lalamusa

Participants/Inclusion and exclusion criteria

Inclusion Criteria: • Age: 35 – 55 years. • Potential participants with 3 months post-stroke lower limb movement difficulties. • Ability to stand up with or without assistive devices • Patients with stable vital signs
Exclusion Criteria: • Subjects with severe hypertension. • Lower limb amputation. • Patients with a history of Deep venous thrombosis or Pulmonary embolism. • Auditory or visual dysfunction. • If the patient has severe receptive or expressive aphasia that affects the ability to communicate with or give consent. • Significant cognitive impairment such as the ability to follow two-level commands.

Intervention groups

Experimental group played video games using X-box and Kinect connected to the laptop. This group performed training for 35-40 minutes, 3 days/week for a total of 6 weeks times duration. The repetitions will increase according to the performance of the patient. Games were started from the basic level and the level was increased according to the patient's performance. The training was done under the supervision of a trained physiotherapist to avoid any hazards.

Randomization (investigator's opinion)

Randomized

Randomization description

Randomization by lottery method. Allocation concealment through a sealed envelope. In a bowl, we put closed slips of groups A and B. Participants fulfilling inclusion criteria randomly picked up groups and then allocated them through a sealed envelope.

Blinding (investigator's opinion)

Single blinded

Blinding description

Patient was not aware of the group treatment

Health conditions studied

1

Description of health condition studied

Stroke: Stroke is a disease of the central nervous system produced by obstruction of the cerebral blood flow due to the occlusion (ischemic stroke) or rupture (hemorrhagic stroke) of a cerebral blood vessel. Afferent and efferent neural pathways are affected, and motor, sensitive and cognitive capabilities become impaired as a result of brain cortex injury. Motor and cognitive damage reduce their functional potential and independence.

Primary outcomes

1

Description

Balance

Timepoint

Before intervention, Mid intervention and After intervention

Method of measurement

Berg Balance Scale

Secondary outcomes

1

Description

Range of Motion

Timepoint

Before intervention, Mid intervention and after intervention

Method of measurement

Through Goniometer

Intervention groups

1

Description

Intervention group: They group played video games using X-box and Kinect connected to the laptop. This group performed training for 35-40 minutes, 3 days/week

for a total of 6 weeks times duration. The repetitions will increase according to the performance of the patient. Games were started from the basic level and the level was increased according to the patient's performance. The training was done under the supervision of a trained physiotherapist to avoid any hazards.

Category

Rehabilitation

2**Description**

Control group: They performed balance exercises such as the tandem walk, heel stand, forward striding, side step, single leg stand, and double leg stand for 35-40 minutes, 3 days/week for a total of 6 weeks times duration. The exercises were done under the supervision of the Physiotherapist.
