Comparing the effectiveness of intralesional injection of steroid in keloid treatment with and without cryotherapy: a randomized controlled trial

Protocol summary

Study aim

Investigating the effect of triamcinolone acetonide injection in keloid alone and with cryotherapy

Design

A randomized clinical trial that is performed simultaneously in two parallel intervention groups including 32 patients and a total of 64 keloid lesions.

Settings and conduct

This study will be carried out at Razi hospital for 32 patients and 64 keloid lesions. In each patient two keloid lesions will be detected and treated, one lesion is treated with steroid and the other lesion is treated with cryotherapy plus steroid.

Participants/Inclusion and exclusion criteria

Inclusion criteria: Patients aged 18-65 years, no previous intralesional injection of verapamil or triamcinolone, existence of more than two keloid lesions
Exclusion criteria: pregnancy, lactation, kidney or liver disease, hematologic disease or bone marrow suppression, systemic or local infection, keloid lesion on face

Intervention groups

This study includes two groups. Intervention of each group will be performed on one side of the body which is randomly chosen. The first group of intervention will undergo intralesional injection of triamcinolone acetonide alone and the second group will get intralesional injection of triamcinolone acetonide along with cryotherapy

Main outcome variables

The main outcome of the study is to compare the effectiveness of two treatment methods on keloid lesions which is evaluated by POSAS (patient and observer scar assessment scale) questionnaire.

Scientific title

Comparing the effectiveness of intralesional injection of steroid in keloid treatment with and without cryotherapy: a randomized controlled trial

Public title

Effectiveness of steroid injection with and without cryotherapy in the treatment of keloid scars

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Age between 18-65 years Patients who didn't have prior intralesional injection with steroid or verapamil More than two lesions are available

Exclusion criteria:

Pregnant patients or patients who are intended to get pregnant Lactation Underlying kidney or liver disease Hematologic disorder or bone marrow suppression Presence of systemic or local infection Keloid in the face area

Age

From **18 years** old to **65 years** old

Gender

Both

Phase

3

Groups that have been masked

No information

Sample size

Target sample size: **32**

More than 1 sample in each individual

Number of samples in each individual: **2**

One side will have single injection of steroid and the other side will have steroid injection with cryotherapy

Randomization (investigator's opinion)

Randomized

Randomization description

Random allocation was done with triamcinolone Tr.A and combined treatment Tr.B. Each person is considered as a block. Double blocks are made in a way that the combination AB (A:Tr.A and B:Tr.B) means the right side of person is injected with Tr.A, and the left side is injected with Tr.B. A random number table was used for the random list. a random number was selected, if the number was between 0 and 4, AB combination and if it was between 5 and 9, BA combination was used, this process is repeated until all Eligible patients are included in the study.

Health conditions studied

1

Description of health condition studied

Keloid

ICD-10 code

L73.0

ICD-10 code description

Acne keloid

Primary outcomes

1

Description

Effectiveness of steroid will be assessed based on POSAS questionnaire

Timepoint

Month 0(baseline), month 3 and month 6

Method of measurement

POSAS(patient and observer scar assessment scale)

Secondary outcomes

1

Description

Effectiveness of steroid with and without cryotherapy based on Fitzpatrick skin type

Timepoint

Month 0(baseline), month 3 and month 6

Method of measurement

Fitzpatrick skin type classification

Intervention groups

1

Description

Intervention group: Keloid lesions of this group will receive intralesional injection of triamcinolone acetonide (40mg/ml) with maximum dose of 20mg/ml for each lesion. injection will be performed every 3 weeks for a total of 4 sessions.

Category

Treatment - Drugs

2

Description

Intervention group: This group of intervention will first receive cryotherapy based on the physician's experience and past guidelines, then immediately the lesion will be injected with triamcinolone acetonide (40 mg/ml) with maximum dose of 20mg/ml, every 3 weeks for a total of 4 sessions.
