Iranian Registry of Clinical Trials

10 Jun 2026

Effect of Deep cross-friction message and Reciprocal inhibition among patients having spastic cerebral palsy

Protocol summary

Study aim

To find out the efficacy of Deep Cross-Friction Massage versus Reciprocal Inhibition on spasticity in cerebral palsy patients

Design

A Randomized, blinded clinical trial with parallel group design of 30 patients

Settings and conduct

The settings in which this study going to conduct is Pakistan Society for Rehabilitation of differently disabled and rising sun institute

Participants/Inclusion and exclusion criteria

Inclusion criteria: • Cerebral palsy patients both male and female.(Zhang and Xiong., 2021) • Age between 2 and 10 years.(Mahmood and Habibullah., 2020) • Muscle tone between I-IV (according to newly revised Ashworth scale)(Zhang and Xiong ., 2021) Exclusion criteria: • Organized diseases involving other organs such as heart, liver, and kidney. • Exclusion of leukodystrophy, infantile spinal muscular atrophy, genetic metabolic diseases such as phenylketonuria, congenital cretinism, and congenital hydrocephalus.

Intervention groups

• Techniques will be administered in two groups. • Group A for reciprocal inhibition and Group B for deep cross-friction massage. • Baseline treatment will include hot pack for 15 minutes and TENS for 20 minutes having intensity between 35 and 50 Hz. • Techniques will be applied for 3 days a week and a single session duration will be 20 minutes. • Total duration will be 4 weeks.

Main outcome variables

Spasticity

Sample size

Target sample size: **30**

Randomization (investigator's opinion)

Randomized

Randomization description

Allocation of patients in two equal groups by lottery method will be through random assignment. Patients were allocated into two groups i.e.; Group A and Group B, by lottery method. Lottery method is a type of simple random sampling. In this method, each participant of the trial is assigned a unique number. 60 cards were placed in a basket and thoroughly mixed. The slips are taken out randomly without looking at them and are placed into two sets. Total of 30 cards were taken out, 15 participants in each group.

Blinding (investigator's opinion)

Single blinded

Blinding description

The blinding is achieved by concealment in which the treatment allocation for each patient is not revealed to the patient. This is done to avoid biasness

Placebo
