COMPARATIVE EFFECTS OF GASTROCNEMIUS MUSCLE ENERGY TECHNIQUE AND STRAIN COUNTERSTRAIN ON GAIT OF FAST BOWLERS WITH GASTROCNEMIUS TRIGGER POINTS

Protocol summary

Study aim

Evaluate the effects of muscle energy technique and strain counterstrain on pain, cadance, stride length, ankle dorsiflexion and planterflexion of fast bowlers with gastrocnemius trigger points.

Design

Randomized clinical trial, Non-probability simple random sampling technique was used in this study.

Settings and conduct

Saeed Ajmal International Cricket Academy Borannwalla Ground Jinnah Bagh Faisalabad Jawad Sports and Cultural Complex

Participants/Inclusion and exclusion criteria

Inclusion Criteria • Fast bowlers willing to participate in the age group of 20-30 years • Fast bowlers having at least one hypersensitive tender nodule within a palpable taut band in the gastrocnemius muscle • Fast bowlers having ankle dorsiflexion range of motion less than 20 degrees • Pain intensity of more than 4 on numeric pain rating scale • Subjects running for 3 days per week for more than 6-months will be recruited Exclusion Criteria • Participants having Fibromyalgia syndrome • Congenital deformity of the foot and ankle • Tumors of the lower back and lower limb • Lower limb fractures • Diabetic neuropathy • Peripheral vascular disease • 3-month recent injuries to legs, foot or ankle will be excluded from the study

Intervention groups

Patients were divided into two group i.e., group A (muscle energy technique group) and group B (strain counterstrain group).

Main outcome variables

Pain Cadence Stride length Ankle dorsiflexion/plantarflexion Sprinting

Purpose

Treatment

Inclusion/Exclusion criteria

Inclusion criteria:

Fast bowlers willing to participate in the age group of 20-30 years Fast bowlers having at least one hypersensitive tender nodule within a palpable taut band in the gastrocnemius muscle Fast bowlers having ankle dorsiflexion range of motion less than 20 degrees Pain intensity of more than 4 on numeric pain rating scale Subjects running for 3 days per week for more than 6-months will be recruited

Exclusion criteria:

Participants having Fibromyalgia syndrome Congenital deformity of the foot and ankle Tumors of the lower back and lower limb Lower limb fractures Diabetic neuropathy Peripheral vascular disease 3-month recent injuries to legs, foot or ankle will be excluded from the study

Age

Actual sample size reached: **42**

Randomization (investigator's opinion)

Randomized

Randomization description

Randomized clinical trial, a single-blinded experimental study was conducted. There was the formation of two study groups out of selected sample naming as group A and group B. Simple random sampling technique was used for the recruitment of study participants and they were allocating to groups using lottery method by keeping the allocation ratio (1:1) for both groups.

Blinding (investigator's opinion)

Single blinded

Blinding description

Participants were blinded from the interventionl groups during the study. They didn't know which study group contain which intervention.

Health conditions studied

1

Description of health condition studied

GASTROCNEMIUS TRIGGER POINTS

ICD-10 code

M70.90

ICD-10 code description

Unspecified soft tissue disorder related to use, overuse and pressure of unspecified site

2

Description of health condition studied

GAIT IN GASTROCNEMIUS TRIGGER POINTS

ICD-10 code

R26.2

ICD-10 code description

Difficulty in walking, not elsewhere classified

Primary outcomes

1

Description

Pain

Timepoint

Before intervention, after 2nd week of intervention and after 4th week of intervention

Method of measurement

Pain was measured using NPRS (numerical pain rating scale)

Secondary outcomes

1

Description

Cadence

Timepoint

Before intervention, after 2nd week of intervention and after 4th week of intervention

Method of measurement

Measured by using stop watch and measuring tape

2

Description

Stride length

Timepoint

Before intervention, after 2nd week of intervention and after 4th week of intervention

Method of measurement

Measured by using stop watch and measuring tape

3

Description

Ankle dorsiflexion/plantarflexion

Timepoint

Before intervention, after 2nd week of intervention and after 4th week of intervention

Method of measurement

Using goniometer

4

Description

Sprinting and Function

Timepoint

Before intervention, after 2nd week of intervention and after 4th week of intervention

Method of measurement

LEFS (lower extremity functional scale)

Intervention groups

1

Description

Intervention group A Muscle Energy Technique (MET): Group A subject received 10 minutes session of moist hot pack from hydro collator at 55 degrees followed by a set of 7 repetitions of calf stretching where each stretch was held static for 10 seconds & after which treatment for each group was performed. This baseline treatment took almost 15 minutes. After that the participants of group A post-isometric relaxation technique of muscle energy technique was used. On a therapeutic bed, the participants were lying face down with their feet dangling off the edge. The individual feels a tension barrier when the dominant foot is gently moved into dorsiflexion. The subject next be told to perform an isometric contraction for seven seconds using 20% of their maximal strength against the therapist's resistance. The subject was told to relax after seven seconds as the therapist moves their ankle into a deeper range of dorsiflexion till, they feel the next stress barrier. This tension barrier continued for 60

seconds. There were three instances of this process. Total session time of group A treatment along with the common/baseline treatment was 30 minutes.

2

Description

Intervention group B Strain Counter Strain (SCS): Group B subject received 10 minutes session of moist hot pack from hydro collator at 55 degrees followed by a set of 7 repetitions of calf stretching where each stretch was held static for 10 seconds & after which treatment for each group was performed. This baseline treatment took almost 15 minutes. After that the subject was laying prone with the knee bent at a 90-degree angle and ankle plantarflexed. Therapist exerted intense manual pressure on the trigger point, had been palpated and hold it 90 seconds. This process was carried out three times. Total session time of group B treatment along with the common/baseline treatment was 30 minutes.
