Comparative Effect Of Post Isometric Relaxation and Static Stretching on Stride Length And Flexibility In Patients With Hamstrings Tightness; A Randomized Clinical Trial

Protocol summary

Study aim

To determine the comparative effect of post isometric relaxation and static stretching on stride length in students with hamstrings tightness.

Design

A single blinded quantitative study following the randomized clinical trial with blinded post-treatment outcome and assessment and randomization will be done by lottery method.

Settings and conduct

The population for this study will be undergraduate students of Government college University Faisalabad, Pakistan. Participants will be blinded they will not be aware which treatment technique will they have. Data will be collected pre and post treatment.

Participants/Inclusion and exclusion criteria

Inclusion Criteria •University students •Age from 18-27 years •Sitting duration more than 6 hours •Subjects with at least 15° loss of knee extension on Active knee extension test •SLR less than 60° •Bilateral Hamstrings tightness Exclusion Criteria • Any recent trauma history (within last 3 months) •Neuromuscular disorders of the lower extremity • Acute spasm of hamstring muscles •Spinal deformity or injury •Leg length discrepancy • Recent hamstring strain •Foot deformity/ disorder

Intervention groups

For static stretching group (Group A) treatment protocol will be passive static stretch with 30 se hold and repeat for 3 in each session. 3 sessions in a week will give to subjects on alternate days and for 3 weeks. For PIR group (Group B) therapist will ask subject to perform isometric contraction with 20% force and hold it for 10 sec after that subject will relax and therapist will apply passive stretch and hold for 30 sec. the same process will be repeated 3 times in each session. 3 sessions in a week will be given to subjects on alternate days and for 3 weeks

Main outcome variables

Stride length and hamstrings flexibility

General information

Reason for update

Acronym

PIR (Post Isometric relaxation), SS (Static Stretching)

Scientific title
Comparative Effect Of Post Isometric Relaxation and Static Stretching on Stride Length And Flexibility In Patients With Hamstrings Tightness; A Randomized Clinical Trial

Public title
Effect of Post Isometric Relaxation and Static Stretching on Stride Length and Flexibility in Patients with Hamstrings Tightness

Purpose
Treatment

Inclusion/Exclusion criteria
Inclusion criteria:
 The University students who have age from 18 to 27 years. Sitting duration more than 6 hours Subjects with at least 15° loss of knee extension on Active knee extension test and SLR less than 60° Subjects having Bilateral Hamstrings tightness
Exclusion criteria:
 Any recent trauma history (within last 3 months) Neuromuscular disorders of the lower extremity Acute spasm of hamstring muscles Spinal deformity or injury Leg length discrepancy Recent hamstring strain Foot deformity/ disorder

Age
From **18 years** old to **27 years** old

Gender
Both

Phase
N/A

Groups that have been masked

- Participant

Sample size
Target sample size: **44**

Randomization (investigator's opinion)
Randomized

Randomization description
Sample is allocated in two groups by simple randomization. Randomization is done by lottery method. Randomly a number is picked and allocated to group A and Group B.

Blinding (investigator's opinion)
Single blinded

Blinding description
Participants of both group will be unaware of the treatment. Participants of both groups will receive the same baseline treatment that is 10 minutes walking. After that Physiotherapist will apply two techniques PIR and SS to both groups and subjects will unaware of that which one will they have.

Health conditions studied

1

Description of health condition studied

Hamstring tightness which represents itself as limited motion at the hip and knee due to the diminished capacity of the muscle to stretch and permit adequate joint movement needed to perform the important activities is common issue. Hamstring tightness is considered to be the result of decrease ability of muscle to elongate which can be due to myofascial adhesions and neural or mechanical problems. This restricted the ability of muscle to glide freely and limit the full joint motion.

ICD-10 code

ICD-10 code description

Primary outcomes

1

Description

Stride Length

Timepoint

Before treatment, after 3 weeks of treatment and after 1 month follow up

Method of measurement

Peadometer

Secondary outcomes

1

Description

Hamstrings Flexibility

Timepoint

Before intervention after 3 weeks of intervention and after 1 month follow up

Method of measurement

By active knee extension test and straight leg raise test

Intervention groups

1

Description

Intervention group1: Static stretching (Group A): For static stretching group treatment protocol will be passive static stretch with 30 se hold and repeat for 3 in each session. 3 sessions in a week will give to subjects on alternate days and for 3 weeks.

Category

Rehabilitation

2

Description

Intervention group 2: Post isometric relaxation (Group B): For PIR group passively flex the hip until restriction will be found at this point therapist will ask subject to perform isometric contraction with 20% force and hold it for 10 sec after that subject will relax and therapist will apply passive stretch and hold for 30 sec. the same process will be repeated 3 times in each session. 3 sessions in a week will be given to subjects on alternate days and for 3 weeks
