Comparison of the effect of aloe vera gel and chlorhexidine gluconate solution 2 % on the prevention of phlebitis caused by peripheral vein catheters in patients admitted to the cardiac intensive care units

Protocol summary

Study aim

Determining and comparing the effect of aloe vera gel and 2% chlorhexidine gluconate solution on the prevention of phlebitis caused by peripheral vein catheters, in patients admitted to Amirul Mominin Hospital (AS) in Zabol city in 2023

Design

Participants are randomly assigned to three test groups using 2% chlorhexidine gluconate solution and aloe vera gel and the control group.

Settings and conduct

This research is a clinical trial study that will be conducted on patients hospitalized in the special care units of Amir al-Mominin Hospital. The participants will be randomly assigned to three test groups.

Participants/Inclusion and exclusion criteria

1. Voluntary participation in the study 2. Age 20 to 70 years 3. Having a healthy upper limb 4. Absence of phlebitis at the site before catheter placement 5. Not taking anticoagulants 6. No history of skin diseases, acute and chronic infection, severe anemia, glaucoma, hypotension (systolic pressure less than 100 mm Hg) 7. Lack of immune system defects 8. No chemotherapy 9. Lack of intravenous nutrition

Intervention groups

After washing the hands for 30 seconds with soap and water and wearing non-sterile gloves, disinfection in the first group is done first with 70% ethyl alcohol, and after drying and entering the venous catheter, then with angioket adhesive that is embedded in the part Its upper part is fixed with half a cc of 2% chlorhexidine gluconate solution, and in the second group, the catheter insertion site is first disinfected with 70% ethyl alcohol, and then after the angioket is inserted, the angioket adhesive pad is soaked with It is aloe vera gel.

Main outcome variables

Reducing phlebitis, hospital costs, increasing patient

satisfaction

Scientific title

Comparison of the effect of aloe vera gel and chlorhexidine gluconate solution 2 % on the prevention of phlebitis caused by peripheral vein catheters in patients admitted to the cardiac intensive care units

Public title

Comparison of the effect of aloe vera gel and chlorhexidine gluconate solution 2 % on the prevention of phlebitis caused by peripheral vein catheters in patients admitted to the cardiac intensive care units

Purpose

Supportive

Inclusion/Exclusion criteria

Inclusion criteria:

Voluntary participation in the study
Age 20 to 70 years
Having a healthy upper limb
Absence of phlebitis at the site before catheter placement
Not taking anticoagulants
No history of skin diseases, acute and chronic infection, severe anemia, glaucoma, hypotension (systolic pressure less than 100 mm Hg)
Lack of immune system defects
No chemotherapy
Lack of intravenous nutrition

Exclusion criteria:

Discharge from the hospital three days before the start of the intervention
Unwillingness to continue cooperation
Rupture or removal of the catheter before 72 hours
pregnancy
Sickness of the patient for any reason
Having diabetes
Simultaneous use of two or more antibiotics
Vasculitis and vascular involvement

Age

From **20 years** old to **70 years** old

Gender

Randomization (investigator's opinion)

Randomized

Randomization description

In this research, first, a list of patients who meet the research inclusion criteria will be prepared, and then the first person will be selected in the first intervention group, the second person will be in the third intervention group, and the third person will be selected in the random allocation method. A control will be placed and this work will continue until all research samples are placed in one of the two intervention or control groups.

Intervention groups

1**Description**

IntervenAfter washing your hands for 30 seconds with soap and water and wearing non-sterile gloves to protect yourself, preparing the intravenous fluid and serum set in a sterile way and choosing the appropriate vein, disinfection in the first group is done with 70% ethyl alcohol. And after the venous catheter is dried and inserted, then the upper part of the catheter insertion site is fixed with angioket adhesive, which has a pad embedded in its upper part, dipped in half a cc of 2% chlorhexidine gluconate solution.

Category

Prevention

2**Description**

In the second group, the catheter insertion site is first disinfected with 70% ethyl alcohol, then the selected area, after drying and entering the venous catheter, is then smeared with half a cc of aloe vera gel with angioket adhesive, which has a pad embedded in its upper part. The upper part of the catheter entry point is fixed.

Category

Prevention

3**Description**

In the control group, only the insertion site of the catheter is disinfected with 70% ethyl alcohol and the catheter is fixed using glue in a standard way. The date, time and name of the researcher are recorded. Every 12 hours to 72 hours, the site is checked and recorded for signs and degree of phlebitis. The serum set in 3 groups is changed every 24 hours and the duration of maintenance of the venous catheter is 72 hours.
