Effect of Baricity of Bupivacaine on the Maternal Hemodynamics during Spinal Anesthesia for Cesarean section

Protocol summary

Summary

Baricity is an important determinant of block characteristics of the spinal anesthesia for cesarean section. The aim of his study to compare the maternal hemodynamic effects and side effects of intrathecally administered isobaric or hyperbaric bupivacaine (both with fentanyl) in parturients undergoing elective cesarean delivery. In this double-blind randomized study, 84 parturient undergoing elective cesarean delivery are randomized to receive a hyperbaric (control group; n=42) or isobaric (study group; n=42) intrathecal solution of 10mg bupivacaine and 15 µg fentanyl during spinal anesthesia is induced in the sitting position. Data collection is included maternal hemodynamics, episodes of hypotension, vasoconstrictor use, leveL OF sensory, and motor block.

General information

Acronym

IRCT registration information

IRCT registration number: **IRCT201401287013N7**
Registration date: **2014-02-12, 1392/11/23**
Registration timing: **registered_while_recruiting**

Last update:
Update count: **0**

Registration date

2014-02-12, 1392/11/23

Registrant information

Name

Simin Atashkhoei

Name of organization / entity

Tabriz University of Medical Siences

Country

Iran (Islamic Republic of)

Recruitment status

Recruitment complete

Funding source

Research Vice Chancellor of Tabriz University of Medical Sciences

Expected recruitment start date

2013-12-09, 1392/09/18

Expected recruitment end date

2014-09-08, 1393/06/17

Actual recruitment start date

empty

Actual recruitment end date

empty

Trial completion date

empty

Scientific title

Effect of Baricity of Bupivacaine on the Maternal Hemodynamics during Spinal Anesthesia for Cesarean section

Public title

Effect of local anesthetic baricity on control of maternal hypotension after spinal anesthesia for cesarean section

Purpose

Prevention

Inclusion/Exclusion criteria

Inclusion criteria: ASA class I; term pregnancy; aged 18-40 years; scheduled for elective cesarean; scheduled for spinal anesthesia Exclusion criteria: weight >85kg; Height >170cm and < 150cm; contraindication for spinal anesthesia; history of systemic or psychopathic disorders; preeclampsia or eclampsia; allergy to local anesthetics

Age

From **18 years** old to **40 years** old

Gender

Female

Phase
N/A
Groups that have been masked

Street address
Research Vice Chanceller; Tabriz University; Daneshgah Street; Tabriz
City
Tabriz
Postal code
Approval date
2013-12-09, 1392/09/18
Ethics committee reference number
92152

Health conditions studied

1

Description of health condition studied
Hypotension after spinal anesthesia
ICD-10 code
I95.2
ICD-10 code description
Hypotension due to drugs

Primary outcomes

1

Description
Blood pressure
Timepoint
Baseline and every 2 minutes after spinal anesthesia to 10 min and then every 5 min to end of surgery
Method of measurement
Manometer

Secondary outcomes

1

Description
Total dose of vasoconstrictors
Timepoint
After spinal anesthesia to end of operation
Method of measurement
Doses of medicatins by mg or ug

Intervention groups

1

Description
In the study group (n=42)0.5 % of isobaric bupivacaine 10 mg with fentanyl 15 µg during spinal anesthesia is administered.
Category
Prevention

2

Description
]n the control group (n=42) hyperbaric bupivacaine 10 mg with fentanyl 15 µg during spinal anesthesia is administered.
Category
Treatment - Drugs

Recruitment centers
