Iranian Registry of Clinical Trials

10 Jun 2026

Investigating the effect of exosome injection extracted from seminal plasma, stem cells derived from Wharton's testosterone gel and FSH on the process of spermatogenesis in NOA individuals.

Protocol summary

Study aim

Investigating the effect of exosome, stem cell injection along with FSH and testosterone for the differentiation of germ cells of non-obstructive Azoospermia to reach gametes that can be injected into eggs.

Design

50 patients with non-obstructive azoospermia refer to Tahura infertility treatment center were identified and after obtaining informed consent, they were included in the plan. Treatment with FSH and testosterone is combined with exosomes isolated from the seminal fluid of healthy individuals and stem cells obtained from Wharton's gel. After three months, these people are re-examined. If sex cells that can be injected into eggs are obtained, sperm and eggs are injected during the laboratory process.

Settings and conduct

50 Azoospermia people will be selected to the Tahora Clinic. These people are divided into 7 groups into the testicular tissue of the first group only exosome and the second group only the Substation and the third group only FSH and testosterone, the fourth group exosome and smelling, the fifth group of the Cell and FSH and testosterone, and the sixth group exosome and Gonadotropin and the seventh group Exosomes, sewage and FSH and testosterone will be injected.

Participants/Inclusion and exclusion criteria

Patients with normal semen samples for exosome extraction from their semen. NOA patients who underwent diagnostic TESE. Patients with abnormal semen samples.

Intervention groups

Stem cell recipient, Exosome recipient, FSH receptor, Stem cell and exosome recipient, Stem cell and FSH recipient, Exosome and FSH receptor, Stem cell, exosome and FSH recipient, Control group, which are azoospermia individuals who do not receive anything.

Main outcome variables

Differentiation of germinal tubercle to obtain injectable germ cells; The possibility of owning a child for NOA Patient, use in infertility treatment clinics.

Scientific title

Investigating the effect of exosome injection extracted from seminal plasma, stem cells derived from Wharton's testosterone gel and FSH on the process of spermatogenesis in NOA individuals.

Public title

Exosome and stem cells therapy

Purpose

Treatment

Inclusion/Exclusion criteria**Inclusion criteria:**

People who do not have sperm in their semen samples (Azoospermia) will be selected. In order to exosome extraction from seminal plasma, people who have normal semen samples (according to global standards (WHO)) will be selected.

Exclusion criteria:

People with obstructive azoospermia Azoospermia whose testicular tissue biopsy did not show germ cells

Age

No age limit

Gender

Male

Health conditions studied**1****Description of health condition studied**

Non-obstructive azoospermia

ICD-10 code

N46

ICD-10 code description

Male infertility

Primary outcomes**1****Description**

Absence of sperm, observation of germ cells in testicular tissue pathology.

Timepoint

3 months after the injection of stem cells, exosome, FSH, testosterone

Method of measurement

Siemens analysis, TESE surgery

Secondary outcomes

empty

Intervention groups**1****Description**

Intervention group: This group receives only 50 microliters of exosomes extracted from the semen of healthy people. Semen samples are collected in the Andrology Laboratory of Tahura Infertility Clinic from patients who come for semen analysis, and then normal samples that count more than 25×10^6 , morphology above 4%, motility above 50%, which is more than 40% progressive movement and finally their DFA is less than 15% are isolated. It should be noted that samples taken from people are examined for HIV, HCV and HPV health. and if the tests are negative, after collecting the samples, Polyethylene glycol (PEG (6000 kDa) will be prepared with a concentration of 500 mg/ml along with sterile PBS (pH 7.4) to extract the exosome. Then 50 μ l of PEG and PBS solution with the mentioned concentration with 250 μ l of cement liquid that passes

through the 0.22 filter, finally after incubation of the mentioned mixture for 12 hours at 4 °C, with a rotation of 3000 rpm for 30 minutes They will be centrifuged at a temperature of 4°C. The supernatant is discarded and the plate is used to check the presence of exosomes with a nanodrop spectrophotometer, the protein concentration of DNA and RNA is then checked with an electron microscope for the presence of exosomes. In addition, CD9, CD 63, CD81, CD82 It will be checked. Finally, 50 microliters of the extracted exosome will be injected into the testicles of non-obstructed azoospermia individuals with an insulin syringe.

2**Description**

Intervention group: This group will receive stem cells extracted from Wharton's gel. Stem cells will be prepared from 7 umbilical cord samples from the private cord blood bank. Umbilical cord donors are healthy mothers, free of genetic and underlying diseases and based on serology tests and free of viral diseases (syphilis, HTLV I/II, HBV, HCV, HIV, and CMV) will be collected during delivery and in sterile PBS containing Penicillin and streptomycin antibiotics will be sent to the umbilical cord stem cell extraction laboratory for stem cell extraction. Finally, vials with a concentration of 10 x 10⁷ cells will be delivered. And a concentration of 5 x 10⁷ cells is injected into each testicle.

Treatment - Other

3**Description**

Intervention group: Participants in this group will be given 10 micromoles of testosterone and 500IU/L of FSH hormone, and after 3 month we will check the differentiation of germ cells with the help of pathology test.

Title and more details about the data/document

All data obtained after identification of study cases can be shared.

When the data will become available and for how long

All information is accessible in April 2025

To whom data/document is available

Our data will be available for all researchers and Doctors

Under which criteria data/document could be used

All information related to the performed ultrasounds, tests related to exosome and stem cell extraction will be accessible

From where data/document is obtainable

Applicants can contact one of the following email addresses to receive documents or data: asalighe@yahoo.com taba_1359@yahoo.com

What processes are involved for a request to access data/document

Three weeks after sending the applicant's message, the requested documents and files will be sent.
