Iranian Registry of Clinical Trials

10 Jun 2026

Therapeutic effects of neurodynamic and active release technique in carpal tunnel syndrome

Protocol summary

Study aim

To compare the Therapeutic Effects of Neurodynamic and Active Release Techniques in Carpal Tunnel Syndrome.

Design

It was a concealed, randomized, single blinded, sham controlled clinical trial with a parallel group design of 12 patients.

Settings and conduct

Study was conducted at Layyah city hospital of govt college university Faisalabad Layyah campus. The study population was consisted of patients with carpal tunnel syndrome. The study was single blinded. The participants didn't know while they were receiving experimental or conventional treatment

Participants/Inclusion and exclusion criteria

Inclusion Criteria: Age is between 25-50 years, both gender, complaints of pain, numbness or tingling in the first three digits, positive Phalen's Sign and unilateral Compression of Nerve Exclusion Criteria: History of Carpal Tunnel Release Surgery, Patients with median nerve involvement in proximal areas such as thoracic outlet syndrome, cervical radiculopathy, Steroid injection in the carpal tunnel, thenar muscle atrophy, metabolic diseases such as diabetes, severe thyroid disorders, anemia and pregnancy

Intervention groups

Participants will be randomly allocated into two groups (Group A: Neurodynamic group, Group B active release technique group). The participants randomly allocated in Group A will be received neural mobilizations.

Participants will execute this training after 10 minutes of infrared. This approach requires three sessions per week for eight weeks. Group B participants will have received treatment includes infrared for 10 min and active release technique.

Main outcome variables

Disabilities of upper extremity (Disabilities of the arm, shoulder and hand questionnaire), Severity (Symptom

Severity Scale)

Sample size

Target sample size: **18**

Actual sample size reached: **12**

Randomization (investigator's opinion)

Randomized

Randomization description

Participants were randomized by using concealed envelope method. In this, sealed opaque envelopes with treatment regimen written were provided to the participants. Once a patient had consented to enter a trial room, an envelope was opened, and the patient was then offered the allocated treatment.

Blinding (investigator's opinion)

Single blinded

Blinding description

Assessor will only assess the patient at baseline, 4th week and at 8th week for treatment outcomes. Assessor safe the data for follow-up and will not share it with any therapist or patient. At any stage, the assessor is unaware of the treatment and control group. The study was single-blinded. The assessor was unaware of the treatment given to either groups 1 or 2

Placebo

Intervention groups

1

Description

Intervention group: Group A received routine physical therapy included infrared. Infrared will be used for 10 minutes in each session. Total duration for each session with intervention will be 25-30 minutes. After baseline treatment, special techniques used for median nerve mobilization include gliding and tension maneuvers with duration of 5 minutes (8 repetitions in which we apply manual technique for 20s and rest for 10s) in each session. 1. Stand with your elbow resting at your side with the hand and fingers pulled back as far as pain allows. Keeping the hand and fingers pulled back gently straighten your elbow. 2. While standing, move the arm slightly out to the side and bring your wrist and hand backwards so your palm is facing outwards.

Category

Rehabilitation

2

Description

Intervention group: Group B received routine physical therapy included infrared. Infrared will be used for 10 minutes in each session. Total duration for each session with intervention will be 25-30 minutes. After baseline treatment, active release technique will be used which is a manual soft-tissue mobilization therapy, means that we use our hands to identify muscle adhesions. Patient will be in sitting position and we will approach to patient on his/her affected side and apply gentle pressure on adhesion point and move thumb on patient Flexor retinaculum clockwise and anticlockwise direction for 5 minutes.

Title and more details about the data/document

Demographic data and data related to final outcome will be shared by maintaining the confidentiality.

When the data will become available and for how long

Data will be available from August 2024 to November 2024 after the 6 months of publication. The data sharing plan for a clinical trial (i.e., what data will be shared when and under what conditions) will be publicly available at a third-party site that shares data with and meets the data requirements of WHO's International Clinical Trials Registry Platform; this occur before the first participant is enrolled.

To whom data/document is available

Deidentified IPD and any additional information will be shared for the people working in academic institution and clinical research writers.

Under which criteria data/document could be used

for research purpose

From where data/document is obtainable

To the corresponding author of the study, Dr Sania Naz and can contact on +923044407035 saaniaanaz@gmail.com can visit these search engines, you can find my study easily here <https://www.researchgate.net/> <https://scholar.google.com/>

What processes are involved for a request to access data/document

Open-access and there is the traditional public data release where anyone can get access to the data with no registration or conditions. The request will be reviewed by Director in Charge and in case of eligibility, it would be shared in two weeks.

Comments

I want randomized clinical trial registration.
