Comparative Evaluation of the Impact of Routine Calcium intake versus Recommended Calcium Intake in Patients Undergoing Total Thyroidectomy

Protocol summary

Study aim

Comparative determination of the effect of routine calcium treatment regimen and the recommended calcium intake regimen in patients undergoing total thyroidectomy

Design

it is a randomized clinical trial study with a control group in a single-blind manner on 40 patients in 2 groups.

Settings and conduct

In a period of 12 months, among the patients referred to Sina Hospital in Tehran, who are candidates for total thyroidectomy surgery in 1402-1404, are included in the study. The patients in this study were candidates for surgery and resection of both thyroid lobes due to multinodular goiter or thyroid cancer. After selecting the patients, the serum calcium level of each person will be measured before the operation. Calcium levels of patients will be checked 12 hours before surgery and every 8 hours after surgery, patients will be checked for signs and symptoms of hypocalcemia and serum calcium levels, and the presence and absence of symptoms will be collected in the checklist.

Participants/Inclusion and exclusion criteria

Patients over 18 years of age, potential early diagnosis of thyroid cancer. planned surgery: complete and bilateral thyroidectomy, with or without various lateral neck extensions, absence of preoperative hypercalcemia, or Any type of kidney disorder that causes calcium metabolism disorder, absence of abnormal preoperative parathyroid hormone level or concomitant parathyroid diseases, absence of history of any type of thyroid or neck surgery.

Intervention groups

Patients were randomly divided into two groups of routine treatment diet (500 mg calcium every 8 hours and 1000 units of calcitriol daily) and high dose calcium treatment (500 mg calcium carbonate every 8 hours, 0.5

microgram calcitriol every 12 hours and 500 mg calcifort every 6 hours)

Main outcome variables

Serum calcium level before and after surgery, Symptoms of hypocalcemia

Scientific title

Comparative Evaluation of the Impact of Routine Calcium intake versus Recommended Calcium Intake in Patients Undergoing Total Thyroidectomy

Public title

Investigation of different calcium treatment regimens on patients after thyroidectomy

Purpose

Treatment

Inclusion/Exclusion criteria**Inclusion criteria:**

Potential early diagnosis of thyroid cancer total thyroidectomy With or without the spread of cancer to the lateral parts of the neck Absence of hypercalcemia before surgery or any kind of kidney disorder that causes calcium metabolism disorder Absence of abnormal preoperative parathyroid hormone levels or concomitant parathyroid diseases No history of any type of thyroid or neck surgery Age over 18 years

Exclusion criteria:

Pathological diagnosis after surgery except papillary thyroid cancer Patients who have a history of taking calcium supplements before surgery History of kidney or urinary tract disease History of radiation therapy or other tumors

Age

From **18 years** old

Gender

Both

Phase

N/A

Groups that have been masked

- Participant
- Care provider
- Investigator

Sample size

Target sample size: **140**

Randomization (investigator's opinion)

Randomized

Randomization description

Patients are randomly assigned to one of 2 treatment groups by block randomization method. Block randomization with different block sizes is used for random allocation. Block sizes are multiples of 2. Initially, block sizes are randomly selected. Finally, one of the different permutations is determined for the equal group size. Random numbers are done using Excel. The study will be done blindly. In such a way that the patients do not know the type of supplement received and the drugs are given to the patients in the same packaging without specifying the specifications, and only the researcher knows the type of drug prescribed and the doctor and the person in charge of evaluating the patients who talk

to the patient, They do not know the prescribed medicine.

Blinding (investigator's opinion)

Double blinded

Blinding description

With the help of getting random numbers using Excel for each patient. The study will be done blindly. In such a way that the patients do not know the type of supplement received and the drugs are given to the patients in the same packaging without any specifications, and only the researcher knows the type of drug prescribed and the doctor and the person in charge of evaluating the patients who talk to the patient about the type of drug Prescribed do not know.

Health conditions studied**1****Description of health condition studied**

Hypocalcemia after total thyroidectomy surgery

ICD-10 code

E83.51

ICD-10 code description

Hypocalcemia

Primary outcomes

1

Description

Serum calcium level before surgery

Timepoint

The calcium level of patients will be checked 12 hours before surgery and will be collected in the checklist.

Method of measurement

The patient's serum calcium level, measured in the laboratory

2

Description

Serum calcium level after surgery

Timepoint

The calcium level of the patients will be checked every 8 hours after the operation and will be collected in the checklist.

Method of measurement

The patient's serum calcium level, measured in the laboratory

Secondary outcomes

1

Description

Symptoms caused by hypocalcemia

Timepoint

Every 8 hours after the operation, the patients will be checked for signs and symptoms of hypocalcemia and the presence and absence of symptoms will be collected in the checklist.

Method of measurement

Expert opinion

Intervention groups

1

Description

intervention group: In this group, they will be treated with a high-dose calcium regimen (500 mg calcium carbonate every 8 hours, 0.5 microgram calcitriol 1 tablet every 12 hours, and 500 mg calcifort every 6 hours) after surgery. The calcium level of patients will be checked 12 hours before surgery and 8 hours after surgery, and every 8 hours after surgery, patients will be checked for signs and symptoms of hypocalcemia and serum calcium level. The presence and absence of symptoms are collected in the checklist. Patients are discharged if there are no hypocalcemic symptoms and normocalcemic serum. Patients will return to the clinic for clinical examinations 5 days after the operation, and the serum calcium level of the patients will be checked again.

Category

Treatment - Drugs

2

Description

Control group: A group of patients received only routine treatment (500 mg of calcium every 8 hours and 1000 units of calcitriol daily) after surgery. The calcium level of patients will be checked 12 hours before surgery and 8 hours after surgery, and every 8 hours after surgery, patients will be checked for signs and symptoms of hypocalcemia and serum calcium level. The presence and absence of symptoms are collected in the checklist. Patients are discharged if there are no hypocalcemic symptoms and normocalcemic serum. Patients will return to the clinic for clinical examinations 5 days after the operation, and the serum calcium level of the patients will be checked again.

Sharing plan**Deidentified Individual Participant Data Set (IPD)**

Undecided - It is not yet known if there will be a plan to make this available

Study Protocol

No - There is not a plan to make this available

Statistical Analysis Plan

Undecided - It is not yet known if there will be a plan to make this available

Informed Consent Form

No - There is not a plan to make this available

Clinical Study Report

Yes - There is a plan to make this available

Analytic Code

No - There is not a plan to make this available

Data Dictionary

Undecided - It is not yet known if there will be a plan to make this available

Title and more details about the data/document

The entire data will be shared after unidentifying people personal data

When the data will become available and for how long

6 months after publishing the results

To whom data/document is available

Researchers working in academic and scientific institutions

Under which criteria data/document could be used

In order to perform further research with the request from the scientific institute

From where data/document is obtainable

Dear applicants will be referred to Sina Hospital's scientific Center for access to Documents and Data or the applicant can email the project executor. the email

address is available. (amiratashi@sina.tums.ac.ir)

What processes are involved for a request to access data/document

After receiving the letter from the project executor, the applicant can refer to Sina Hospital Research Center and after the approval of the executor, the documents and data will be available to executor within a week or the applicant can email directly to project executor so the executor provide the information
