Thoracic mobilization versus sling-based thoracic active exercises on pain, function and quality of life in patients with non-specific neck pain

Protocol summary

Study aim

To find out the effects of thoracic mobilization with and without sling based thoracic active exercises on pain, function and quality of life in patients with non-specific neck pain.

Design

It is a Randomized controlled trial. Sample size is estimated to be 44 i.e: 22 in each group. After adding drop out rate the sample size is 52 i.e: 26 in each group. There are two groups namely group A and group B. Group A will receive sling-based thoracic active exercises with thoracic mobilization and cervical manual therapy for 4 weeks while group B will receive thoracic mobilization and cervical manual therapy for 4 weeks. Data will be collected at 3 intervals i.e: 0 week (baseline), 2nd week and 4th week (after completion of treatment) from both groups. Participants will be allocated to the groups randomly by using lottery method to minimize bias. It is a single blinded study, assessor is blinded. Study is conducted at Physiotherapy department of University of Lahore Teaching Hospital Lahore.

Settings and conduct

University of Lahore Teaching Hospital Physiotherapy department. It is a single blinded study, assessor will be blinded.

Participants/Inclusion and exclusion criteria

Inclusion Criteria: 20-45 years old, Both males and females are included, diagnosed patients of non-specific neck pain, NDI score equal to or more than 24 Exclusion Criteria: The presence of neurological signs and symptoms, previous surgical history related to spine or neck, Currently undergoing any injection treatment to reduce pain, Neurological issues, Pregnancy, Cardiac disease, Active infection

Intervention groups

Group A: sling-based thoracic active exercises with thoracic mobilization and cervical manual therapy Group B: thoracic mobilization and cervical manual therapy

Main outcome variables

Pain Function Quality of life

Scientific title
Thoracic mobilization versus sling-based thoracic active exercises on pain, function and quality of life in patients with non-specific neck pain

Public title
Thoracic mobilization versus sling-based thoracic active exercises on pain, function and quality of life in patients with non-specific neck pain

Purpose
Treatment

Inclusion/Exclusion criteria
Inclusion criteria:
20-45 years old Both male and female Diagnosed with non-specific neck pain NDI score is equal to or more than 24

Exclusion criteria:
The presence of neurological signs and symptoms
Previous surgical history related to spine or neck
Currently undergoing any injection treatment to reduce pain
Neurological issues
Pregnancy
Cardiac disease
Active infection

Age
From **20 years** old to **45 years** old

Gender
Both

Phase
0

Groups that have been masked

- Outcome assessor

Sample size
Target sample size: **52**

Randomization (investigator's opinion)
Randomized

Randomization description
After screening, all the participants will be randomly allocated into 2 groups through lottery method: Group A (Experimental group: Sling based thoracic active exercise + thoracic mobilization + cervical manual therapy) and Group B (Control group: Thoracic mobilization + cervical manual therapy)

Blinding (investigator's opinion)
Single blinded

Blinding description
In a single-blinded study where the assessor is blind, the person evaluating the outcomes or measurements of the study participants is unaware of which participants belong to the control group and which belong to the experimental group. This helps to prevent bias in the assessment of the outcomes

Placebo
Not used

Assignment
