

Clinical Trial Protocol

Iranian Registry of Clinical Trials

10 Jun 2026

Comparison of physical exercises with physical exercises and psychological exercises on pain, range of motion, lower extremity strength. Quality of life and Kinesiophobia in the elderly with chronic back pain

Protocol summary

Study aim

The main purpose of the research is to compare physical therapy exercises and the combination of physical exercises with psychological exercises on pain, range of motion, lower limb strength, quality of life and kinesiophobia in the elderly with chronic back pain.

Design

Clinical trial with two exercises groups, with parallel groups, double-blind, randomized, phase 2 on 30 patients. A random generator software will be used for randomization.

Settings and conduct

The present research will be conducted at Bu-Ali Sina University for eight weeks, three sessions per week. Due to the nature of exercise therapy and assessment, blinding of practitioners will not be possible, but participants and one of the researchers who will measure assessments before and immediately after eight weeks will be blinded to group allocation.

Participants/Inclusion and exclusion criteria

Inclusion criteria include elderly people 60-80 years old; history of low back pain for more than three months; back pain in the range of 2.5 out of 10 on the Numerical Pain Rating Scale (NPRS); independence in daily activities; no use of assistive devices; no history of illness. cardiovascular and respiratory problems, and exclusion criteria included having any respiratory disease; pregnancy or history of surgery in the lumbar region; inability to exercise; occurrence of pain during the exercise protocol; obvious abnormality; body mass index (BMI) more than 30; non-cooperation and withdrawing from the research; absence in two consecutive sessions and three alternating training sessions.

Intervention groups

1. Combined Feldenkrais exercises and dynamic

neuromuscular stability group. 2. Dynamic neuromuscular exercises group.

Main outcome variables

Intensity of pain; range of motion of the spine; lower limb strength; quality of life; kinesiophobia

Scientific title

Comparison of physical exercises with physical exercises and psychological exercises on pain, range of motion, lower extremity strength. Quality of life and Kinesiophobia in the elderly with chronic back pain

Public title

Effect of physical exercises and psychological exercises in chronic back pain

Purpose

Treatment

Inclusion/Exclusion criteria**Inclusion criteria:**

Low back pain in the range of 2-5 out of 10 on the Numerical Pain Rating Scale (NPRS) History of back pain for more than three months Non-use of auxiliary equipment No history of cardiovascular diseases and respiratory problems No history of fractures and severe injuries in the lower limbs and spine Non-participation in therapeutic interventions during the last 4 weeks Voluntary participation in research Independence in daily activities

Exclusion criteria:

Having any respiratory disease, pregnancy or history of surgery in the lumbar region Inability to exercise Occurrence of pain during the training protocol Obvious abnormality that is problematic for the implementation of research Body mass index (BMI) greater than 30

AgeFrom **60 years** old to **80 years** old**Gender**

Female

Phase

2

Groups that have been masked

- Participant
- Outcome assessor

Sample sizeTarget sample size: **30****Randomization (investigator's opinion)**

Randomized

Randomization description

Participants will be divided into two groups, Feldenkrais and DNS combined exercises group and DNS exercise group by Random Number Generator. This method ensures that each participant has an equal chance of being assigned to either group, reducing selection bias.

Blinding (investigator's opinion)

Double blinded

Blinding description

Due to the nature of the therapeutic exercise and evaluation, athletes will not be able to do it, but the participants and one of the researchers who will evaluate will measure after eight weeks, they will be assigned to groups.

M54.5

ICD-10 code description

Low back pain

Primary outcomes**1****Description**

Pain

Timepoint

Pre-test at the beginning of the study (3 to 5 days before the start of the intervention) and post-test at the end of the intervention (three to five days after the last training session)

Method of measurement

Using Visual Analogue Scale of pain intensity

2

Description

Lumbar range of motion

Timepoint

Pre-test at the beginning of the study (3 to 5 days before the start of the intervention) and post-test at the end of the intervention (three to five days after the last training session)

Method of measurement

Modified -Modified Schober's Test

3

Description

Lower limb strength

Timepoint

Pre-test at the beginning of the study (3 to 5 days before the start of the intervention) and post-test at the end of the intervention (three to five days after the last training session)

Method of measurement

30 Seconds Sit To Stand Test

4

Description

Quality of life

Timepoint

Pre-test at the beginning of the study (3 to 5 days before the start of the intervention) and post-test at the end of the intervention (three to five days after the last training session)

Method of measurement

36-Item Short Form Survey Instrument

5

Description

Kinesiophobia

Timepoint

Pre-test at the beginning of the study (3 to 5 days before the start of the intervention) and post-test at the end of the intervention (three to five days after the last training session)

Method of measurement

Tempa scale
