The role of stretching protocols in enhancing post-fatigue performance and flexibility in soccer

Protocol summary

Study aim

The study compares the effects of static stretching, slow dynamic stretching, and fast dynamic stretching on performance recovery, flexibility, balance, speed, and agility after a functional fatigue protocol in football players. Additionally, it aims to identify the most effective stretching technique for maintaining or enhancing performance after fatigue in football players.

Design

The present study includes 40 participants. The participants will be randomly assigned to four groups—static stretching, fast dynamic stretching, slow dynamic stretching, and control—using simple randomization and the method of random assignment by drawing names from a ball.

Settings and conduct

In the present study, participants will perform the research interventions and the fatigue protocol at their training location.

Participants/Inclusion and exclusion criteria

Participants must have a body mass index (BMI) of 20-25 and no history of lower limb injury, trauma, or disease in the past six years, along with a limited range of motion. Additionally, they must have at least three years of regular training experience in football (three sessions per week) and should not be simultaneously participating in any other lower limb stretching program.

Intervention groups

The present study includes four groups: static stretching, fast dynamic stretching, slow dynamic stretching, and control. The first three groups perform their intervention program in a single session following a functional fatigue protocol, while the control group does not receive any intervention after fatigue.

Main outcome variables

The outcome variables of the present study are improvement in balance, flexibility, agility, and vertical jump performance.

General information

Reason for update

Since this study was conducted in a single-blind manner, the blinding procedure section has been updated.

Scientific title

The role of stretching protocols in enhancing post-fatigue performance and flexibility in soccer

Public title

Comparison of three stretching protocols after fatigue in football players

Purpose

Prevention

Inclusion/Exclusion criteria

Inclusion criteria:

Body Mass Index (BMI) 20-25 No history of lower limb injury, trauma, or disease in the past six years, with limited range of motion. Participants must have at least three years of regular training experience in football (three sessions per week). No participation in a lower limb stretching program. Participants should be aged between 18-25 years old.

Exclusion criteria:

Age

From **18 years** old to **25 years** old

Gender

Male

Phase

N/A

Groups that have been masked

- Outcome assessor

Sample size

Target sample size: **40**

Randomization (investigator's opinion)

Randomized

Randomization description

In the present study, participants are randomly assigned to four groups—static, slow dynamic, fast dynamic, and control—using a lottery draw method by pulling names from a ball.

Blinding (investigator's opinion)

Single blinded

Blinding description

After assigning participants to each group, the outcome assessor was unaware of (or: was blinded to) the group allocation.

Health conditions studied

1

Description of health condition studied

Comparison of three types of stretching protocols pre and post of functional fatigue in soccer players

ICD-10 code

ICD-10 code description

Primary outcomes

1

Description

In the present study, flexibility is being examined.

Timepoint

Before and after the application of the fatigue protocol.

Method of measurement

Flexibility is assessed using the modified Thomas test and PKET.

2

Description

In the present study, balance is being investigated.

Timepoint

Before and after the application of the fatigue protocol.

Method of measurement

Balance is measured using the Y Balance Test.

3

Description

In the present study, agility is being investigated.

Timepoint

Before and after the application of the fatigue protocol.

Method of measurement

Agility is evaluated using the Illinois Agility Test

4

Description

In the present study, speed is being examined.

Timepoint

Before and after the application of the fatigue protocol.

Method of measurement

Speed is assessed using the 20-meter sprint test.

5

Description

In the present study, vertical jump is being examined.

Timepoint

Before and after the application of the fatigue protocol.

Method of measurement

Vertical jump is assessed using the countermovement jump test.

Secondary outcomes

empty

Intervention groups

1

Description

Intervention group: Static stretching of the hamstrings and quadriceps will include standing hamstring stretches (standing with feet hip-width apart and knees straight, participants bend forward while lowering their heads and wrapping their hands around the calf of one leg) followed by calf raises (from an initial standing position with knees straight, participants raise one leg upward while bending at the hip). Quadriceps stretching will be performed using a standing quadriceps stretch (participants stand on one leg while bending the opposite knee and holding it behind them with one hand for balance) followed by lunges (participants position one foot forward and one foot back while bending the front knee). Each stretch will be held for 30 seconds with two repetitions (once for each leg).

Category

Prevention

2

Description

Intervention group: The fast dynamic group will perform the stretches like the static group, with the only difference being that each movement will be done at 100 beats per minute.

Category

Prevention

3

Description

Intervention group: The fast dynamic group will perform the stretches like the static group, with the only difference being that each movement will be done at 50 beats per minute.

Category

Prevention

4

Description

Control group: The control group will engage in 5 minutes of active rest in the form of walking.

Title and more details about the data/document

All data will be shared after anonymizing individuals,
ensuring their non-identifiability.

When the data will become available and for how long

The data access period will start immediately after the
results are printed.

To whom data/document is available

The data will be made available to researchers,
organizations, and institutions related to the field of
football and also for publication in accessible journals.

Under which criteria data/document could be used

In order to assist scientific research and promote the
implementation of executive goals with a focus on
reducing musculoskeletal injuries and enhancing the
performance of football players in the field,

From where data/document is obtainable

Mohammad Alimoradi/malimoradi@sport.uk.ac.ir

What processes are involved for a request to access data/document

Requests for access to data will be answered within a

week
