The effect of supervised rehabilitation on gait symmetry and regularity after acute ankle sprain

Protocol summary

Study aim
Determining the effect of supervised rehabilitation on gait symmetry and regularity after acute ankle sprain

Design
This study is a quasi-experimental clinical trial.

Settings and conduct
This study will be conducted on 16 patients with acute ankle sprain. This is a quasi-experimental clinical trial with a pre-post design; therefore, randomization or blinding is not possible in this study.

Participants/Inclusion and exclusion criteria
Inclusion criteria: Patients aged between 18 and 50 years, Patients with Grade 1 or 2 ankle sprain, Patients with an acute ankle sprain, meaning the injury occurred between 7 days and 1 month ago, Presence of symptoms such as swelling or pain on the lateral side of the ankle, limited ankle range of motion, and tenderness over the lateral ligaments, Minimum literacy level, with the ability to read and write at least at a middle school level

Intervention groups
The intervention group will receive 10 supervised ankle rehabilitation sessions. Each intervention session, which includes electrotherapy and therapeutic exercises, will last between 1.5 to 2 hours. Overall, the therapeutic exercises will include strengthening, neuromuscular, range of motion, and balance exercises. The duration of electrotherapy in each session will be between 15 to 30 minutes, using TENS (Transcutaneous Electrical Nerve Stimulation). Strengthening exercises for the muscles around the ankle will be performed using resistance bands of varying levels. Balance and proprioception exercises will be conducted using a balance board and other related equipment.

Main outcome variables
step regularity; stride regularity; gait symmetry

Scientific title
The effect of supervised rehabilitation on gait symmetry and regularity after acute ankle sprain

Public title
The effect of rehabilitation on gait symmetry and regularity
Purpose
Treatment
Inclusion/Exclusion criteria
Inclusion criteria:
Patients aged between 18 and 50 years Patients with Grade 1 or 2 ankle sprain Patients with an acute ankle sprain, meaning the injury occurred between 7 days and 1 month ago Presence of symptoms such as swelling or pain on the lateral side of the ankle, limited ankle range of motion, and tenderness over the lateral ligaments Minimum literacy level, with the ability to read and write at least at a middle school level
Exclusion criteria:
Patients with syndesmotic injury in addition to the ankle sprain. Patients with a history of surgery or fracture in the lower limbs within the past year. Patients who had sustained an acute injury to the musculoskeletal structures of other lower limb joints within the past three months that affected joint integrity and function—such as a sprain or fracture—and had missed at least one day of their usual physical activity. Patients with neurological disorders such as stroke, multiple sclerosis (MS), or neuropathy. Individuals who had experienced an ankle sprain within the past 12 months. In the treatment of ankle sprains, initial protection is typically provided for one to two weeks, followed by the use of bandages or tape, which does not interfere with our study. However, patients using foot or ankle orthoses were excluded from the study.

Health conditions studied

1

Description of health condition studied
acute ankle sprain
ICD-10 code
S93.4
ICD-10 code description
Sprain of ankle

Primary outcomes

1

Description
Step regularity based on trunk acceleration
Timepoint
Before the intervention and immediately after the tenth session of supervised ankle rehabilitation.
Method of measurement
The Phyphox software installed on the mobile phone

2

Description
Stride regularity based on trunk acceleration
Timepoint
Before the intervention and immediately after the tenth session of supervised ankle rehabilitation.
Method of measurement
The Phyphox software installed on the mobile phone

3

Description
Gait symmetry based on trunk acceleration
Timepoint
Before the intervention and immediately after the tenth session of supervised ankle rehabilitation.
Method of measurement

The Phyphox software installed on the mobile phone

Secondary outcomes

empty

Intervention groups

1

Description

Intervention Group:In this study, the intervention consists of supervised ankle rehabilitation. Supervised ankle rehabilitation refers to the use of electrotherapy and exercise therapy based on current guidelines. The rehabilitation program will be conducted over 10 sessions (approximately 3 sessions per week). The duration of electrotherapy in each session will range from 15 to 30 minutes (using TENS current). Each intervention session, which includes both electrotherapy and exercise therapy, will last between 1.5 to 2 hours.In general, the exercise therapy includes strengthening, neuromuscular, range of motion, and balance exercises. Strengthening exercises for the muscles surrounding the ankle will be performed using resistance bands of varying levels. Balance and proprioception training will be carried out using a balance board and other equipment.
