Comparative Effects of Instrumental Assisted Soft Tissue Mobilization and Deep Transverse Friction Massage in Patients with Mechanical Neck Pain

Protocol summary

Study aim

to compare the effects of Instrumental Assisted Soft Tissue Mobilization and Deep Transverse Friction Massage on patients with Mechanical Neck Pain

Design

Pragmatic, Community based, parallel group, single blinded, randomized control trial

Settings and conduct

Madina teaching hospital faisalabad

Participants/Inclusion and exclusion criteria

Inclusion criteria Age group (18-40) year. Gender both). Patient having neck pain score 5 or more than 5. Patient having NDI score 14 or more. Patients with inclusive criteria asked to sign the written consent to take part in the research. Exclusion criteria Participants diagnose to any musculoskeletal or auto immune disorder. Any participant with congenital anomalies like cervical rib etc. Having past family history of radiculopathy of the cervical region and cervical trauma. Participant with bilateral trapezius spasm.

Intervention groups

Instrument- assisted soft tissue mobilization .Patients are in this group will give a hot pack, before applying, the advantage of the Garston technique over. Due to its effectiveness and lack of invasiveness, the Garston procedure is expanding quickly. Lubricate the region that has been treated. For 40-120 seconds, try Garston at a 30-60 direction. Deep Transverse Friction Massage. Later power will be applied to the implementation. area to lessen friction, and the skin will be damp and talcum powder will be used. To avoid bruising it was crucial that the therapist's fingertips and the patient's skin moved together as one throughout friction. Instead of sliding over the skin, the fingers engage together it. This technique will cause numbness in the affected area after a few minutes. For four weeks, on three days a week 15-minute sessions were used for therapy.

Main outcome variables

NPRS, GONIOMETER, NECK DISABILITY INDEX

Scientific title

Comparative Effects of Instrumental Assisted Soft Tissue Mobilization and Deep Transverse Friction Massage in Patients with Mechanical Neck Pain

Public title

IASTM vs DTFM on mechanical neck pain

Purpose

Education/Guidance

Inclusion/Exclusion criteria

Inclusion criteria:

Age group (18-40) year Gender both (male and female) Patient having neck pain score 5 or more than 5 Patient having NDI score 14 or more Patients with inclusive criteria asked to sign the written consent to take part in the research

Exclusion criteria:

Participants diagnose to any musculoskeletal or autoimmune disorder Any participant with congenital anomalies like cervical rib etc Having past family history of radiculopathy of the cervical region and cervical trauma Having any neurological or psychological complications and vascular disorder or infectious disease Participant with bilateral trapezius spasm Any participant with history of recent surgery to neck or upper trunk Suffering from diabetes mellitus

Age

From **18 years** old to **40 years** old

Gender

Both

Phase

N/A

Groups that have been masked

Sample size

Target sample size: **34**

Actual sample size reached: **34**

Randomization (investigator's opinion)

Randomized

Randomization description

Randomization through sealed envelope. On probability convenient sampling will use for the study, group allocation will be done by chit and draw method.

Blinding (investigator's opinion)

Single blinded

Blinding description

It is a single blind study, participants will be blinded as they will not know the treatment which they will receive

Placebo

Not used

QUESTIONNAIRE

Intervention groups

1

Description

Intervention group: Instrument- assisted soft tissue mobilization Patients are in this group will give a hot pack, before applying, the advantage of the Garston technique over other soft tissue mobilization techniques is that deeper restrictions can be accessible since the metallic exterior of the instruments, such as the deeper fingertip padding, has no impact on tissues. Due to its effectiveness and lack of invasiveness, the Garston procedure is expanding quickly. tips and margins of the apparatus. Lubricate the region that has been treated. For 40-120 seconds, try Garston at a 30-60 direction. This will improve blood supply to the tissues on both sides. If more redness develops after therapies, apply a pack of ice to reduce hyperemia.

Description

Intervention group: Deep Transverse Friction Massage This group of patients will get a deeply transverse the friction massage. To begin a heated pack will be utilized, and the treatment area must be cleaned with cotton and dried out before receiving treatment. Later power will be applied to the implementation. area to lessen friction, and the skin will be damp and talcum powder will be used. To avoid bruising it was crucial that the therapist's fingertips and the patient's skin moved together as one throughout friction. Direct massage over the lesion and pain site is required. Instead of sliding over the skin, the fingers engage together it. This technique will cause numbness in the affected area after a few minutes. For four weeks, on three days a week 15-minute sessions were used for therapy.

Title and more details about the data/document

Comparative effects of instrumental assisted soft tissue mobilization and deep transverse friction massage in patients with mechanical neck pain

When the data will become available and for how long

starting from 2025

To whom data/document is available

only available for people working in academic institutions

Under which criteria data/document could be used

Data will be available to researchers with valid affiliation to any institute

From where data/document is obtainable

saira53saira@gmail.com

What processes are involved for a request to access data/document

Inquirer must provide cover letter stating their reason to obtain data and a brief outlook of their research
